Safety and General Information

Safety Precautions

To ensure safe operation please read the following statements and understand their meaning. Also refer to your equipment manufacturer's manual for other important safety information. This manual contains safety precautions which are explained below. Please read carefully.

⚠️ WARNING
Warning is used to indicate the presence of a hazard that can cause severe personal injury, death, or substantial property damage if the warning is ignored.

⚠️ CAUTION
Caution is used to indicate the presence of a hazard that will or can cause minor personal injury or property damage if the caution is ignored.

NOTE
Note is used to notify people of installation, operation, or maintenance information that is important but not hazard-related.

For Your Safety!
These precautions should be followed at all times. Failure to follow these precautions could result in injury to yourself and others.

⚠️ WARNING
Accidental Starts can cause severe injury or death.
Disconnect and ground spark plug leads before servicing.

⚠️ WARNING
Rotating Parts can cause severe injury.
Stay away while engine is in operation.

⚠️ WARNING
Hot Parts can cause severe burns.
Do not touch engine while operating or just after stopping.

Accidental Starts!
Disabling engine. Accidental starting can cause severe injury or death. Before working on the engine or equipment, disable the engine as follows: 1) Disconnect the spark plug lead(s). 2) Disconnect negative (-) battery cable from battery.

Rotating Parts!
Keep hands, feet, hair, and clothing away from all moving parts to prevent injury. Never operate the engine with covers, shrouds, or guards removed.

Hot Parts!
Engine components can get extremely hot from operation. To prevent severe burns, do not touch these areas while the engine is running - or immediately after it is turned off. Never operate the engine with heat shields or guards removed.
Section 1
Safety and General Information

**WARNING**
Explosive Fuel can cause fires and severe burns.

Do not fill the fuel tank while the engine is hot or running.

**Explosive Fuel!**
Gasoline is extremely flammable and its vapors can explode if ignited. Store gasoline only in approved containers, in well ventilated, unoccupied buildings, away from sparks or flames. Do not fill the fuel tank while the engine is hot or running, since spilled fuel could ignite if it comes in contact with hot parts or sparks from ignition. Do not start the engine near spilled fuel. Never use gasoline as a cleaning agent.

**WARNING**
Carbon Monoxide can cause severe nausea, fainting or death.

Avoid inhaling exhaust fumes, and never run the engine in a closed building or confined area.

**Lethal Exhaust Gases!**
Engine exhaust gases contain poisonous carbon monoxide. Carbon monoxide is odorless, colorless, and can cause death if inhaled. Avoid inhaling exhaust fumes, and never run the engine in a closed building or confined area.

**WARNING**
Explosive Gas can cause fires and severe acid burns.

Charge battery only in a well ventilated area. Keep sources of ignition away.

**Explosive Gas!**
Batteries produce explosive hydrogen gas while being charged. To prevent a fire or explosion, charge batteries only in well ventilated areas. Keep sparks, open flames, and other sources of ignition away from the battery at all times. Keep batteries out of the reach of children. Remove all jewelry when servicing batteries.

Before disconnecting the negative (-) ground cable, make sure all switches are OFF. If ON, a spark will occur at the ground cable terminal which could cause an explosion if hydrogen gas or gasoline vapors are present.

**WARNING**
Electrical Shock can cause injury.

Do not touch wires while engine is running.

**Electrical Shock!**
Never touch electrical wires or components while the engine is running. They can be sources of electrical shock.

**WARNING**
Uncoiling Spring can cause severe injury.

Wear safety goggles or face protection when servicing retractable starter.

**Spring Under Tension!**
Retractable starters contain a powerful, recoil spring that is under tension. Always wear safety goggles when servicing retractable starters and carefully follow instructions in Retractable Starter Section 7 for relieving spring tension.

**WARNING**
Cleaning Solvents can cause severe injury or death.

Use only in well ventilated areas away from ignition sources.

**Flammable Solvents!**
Carburetor cleaners and solvents are extremely flammable. Keep sparks, flames, and other sources of ignition away from the area. Follow the cleaner manufacturer’s warnings and instructions on its proper and safe use. Never use gasoline as a cleaning agent.
Engine Identification Numbers
When ordering parts, or in any communication involving an engine, always give the Model, Specification, and Serial Numbers, including letter suffixes if there are any.

The engine identification numbers appear on a decal, or decals, affixed to the engine shrouding. See Figure 1-1. An explanation of these numbers is shown in Figure 1-2.

A. Model No.
Command Engine
Horizontal Crankshaft
Numerical Designation
270
395
440

B. Spec. No.
Engine Model Code CH270-0001
Complete Spec Number
(Incorporating Model No. with Variation No. of Basic Spec.)

C. Serial No.
Year Manufactured Code
Code Year
39 2009
40 2010
41 2011

Figure 1-2. Explanation of Engine Identification Numbers.
Section 1
Safety and General Information

Oil Recommendations
Using the proper type, weight, and a consistent brand of oil in the crankcase is extremely important. So is checking oil daily and changing oil regularly. Failure to use the correct oil, or using dirty oil, causes premature engine wear and failure.

Oil Type
Use high-quality detergent oil of API (American Petroleum Institute) Service Class SJ or higher. Select the viscosity based on the air temperature at the time of operation as shown in Figure 1-3.

Fuel Recommendations

WARNING: Explosive Fuel!
Gasoline is extremely flammable and its vapors can explode if ignited. Before servicing the fuel system, make sure there are no sparks, open flames or other sources of ignition nearby as these can ignite gasoline vapors. Disconnect and ground the spark plug leads to prevent the possibility of sparks from the ignition system.

General Recommendations
Purchase gasoline in small quantities and store in clean, approved containers. A container with a capacity of 2 gallons or less with a pouring spout is recommended. Such a container is easier to handle and helps eliminate spillage during refueling.

Do not use gasoline left over from the previous season, to minimize gum deposits in your fuel system and to ensure easy starting.

Do not add oil to the gasoline.

Do not overfill the fuel tank. Leave room for the fuel to expand.

Fuel Type
For best results use only clean, fresh, unleaded gasoline with a pump sticker octane rating of 87 (R+M)/2 or higher. In countries using the Research Octane Number (RON), it should be 90 octane minimum. Leaded gasoline is not recommended and must not be used on EFI engines or on other models where exhaust emissions are regulated.

Gasoline/Alcohol blends
Gasohol (up to 10% ethyl alcohol, 90% unleaded gasoline by volume) is approved as a fuel for Kohler engines. Other gasoline/alcohol blends including E20 and E85 are not to be used and not approved. Any failures resulting from use of these fuels will not be warranted.

Gasoline/Ether blends
Methyl Tertiary Butyl Ether (MTBE) and unleaded gasoline blends (up to a maximum of 15% MTBE by volume) are approved as a fuel for Kohler engines. Other gasoline/ether blends are not approved.
Periodic Maintenance Instructions

**WARNING: Accidental Starts!**
Disabling engine. Accidental starting can cause severe injury or death. Before working on the engine or equipment, disable the engine as follows: 1) Disconnect the spark plug lead(s). 2) Disconnect negative (-) battery cable from battery.

Maintenance Schedule
Normal maintenance, replacement or repair of emission control devices and systems may be performed by any repair establishment or individual; however, warranty repairs must be performed by a Kohler authorized service center.

¹Perform these maintenance procedures more frequently under extremely dusty, dirty conditions.
²Have a Kohler Engine Service Dealer perform this service.

Storage
If the engine will be out of service for 2 months or more, use the following storage procedure.

1. Clean the exterior surfaces of the engine.
2. Change the oil while the engine is still warm from operation. See Change Oil in Section 6.
3. The fuel system must be completely emptied, or the gasoline must be treated with a stabilizer to prevent deterioration. If you choose to use a stabilizer, follow the manufacturer’s recommendations, and add the correct amount for the capacity of the fuel system.
   
   Fill the fuel tank with clean, fresh gasoline. Run the engine for 2 to 3 minutes to get stabilized fuel into the carburetor.

   To empty the system, run the engine until the tank and the system are empty.

4. Remove the spark plug. Add one tablespoon of engine oil into the spark plug hole. Install the spark plug, but do not connect the plug lead. Crank the engine two or three revolutions.

5. Remove the spark plug. Cover the spark plug hole with your thumb, and turn the engine over until the piston is at the top of its stroke. (Pressure against the thumb is greatest.) Reinstall the plug, but do not connect the plug lead.

6. Store the engine in a clean, dry place.

Section 1
Safety and General Information

Center Compression Ring End Gap

New Bore
- CH270: 0.325/0.400 mm (0.013/0.016 in.)
- CH395: 0.650/0.800 mm (0.026/0.032 in.)
- CH440: 0.640/0.800 mm (0.025/0.032 in.)

Used Bore (Max.)
- CH270: 1.00 mm (0.039 in.)
- CH395, CH440: 1.50 mm (0.059 in.)

Oil Control Ring-to-Groove Side Clearance
- CH270, CH395: 0.05/0.19 mm (0.0019/0.0075 in.)
- CH440: 0.09/0.15 mm (0.0035/0.0059 in.)

Piston Thrust Face O.D.

New
- CH270: 69.970/69.960 mm (2.755/2.754 in.)
- CH395: 77.955/77.975 mm (3.071/3.070 in.)
- CH440: 88.955/88.975 mm (3.502/3.503 in.)

Max. Wear Limit
- CH270: 69.82 mm (2.749 in.)
- CH395: 77.82 mm (3.064 in.)
- CH440: 88.82 mm (3.497 in.)

Piston Thrust Face-to-Cylinder Bore Running Clearance
- CH270: 0.057/0.075 mm (0.002/0.003 in.)
- CH395, CH440: 0.033/0.067 mm (0.001/0.003 in.)

Rocker Arm

Rocker Arm Stud Torque: 13.6 N·m (120 in. lb.)
Rocker Arm Pivot Jam Nut Torque: 10 N·m (89 in. lb.)

Retractable Starter

Retractable Starter Cover Screw Torque: 5.4 N·m (48 in. lb.)
Retractable Starter Center Screw Torque: 10 N·m (89 in. lb.)

Valve Cover

Valve Cover Fastener Torque: 10 N·m (89 in. lb.)

Valves and Valve Lifters

Intake Valve Stem-to-Valve Guide Running Clearance
- CH270: 0.038/0.065 mm (0.0015/0.0026 in.)
- CH395, CH440: 0.025/0.055 mm (0.0010/0.0022 in.)

Exhaust Valve Stem-to-Valve Guide Running Clearance
- CH270: 0.085/0.112 mm (0.0033/0.0044 in.)
- CH395, CH440: 0.040/0.07 mm (0.0016/0.0026 in.)

2 Measure 21.8-22.2 mm (0.8583-0.8740 in.) above the bottom of the piston skirt at right angles to the piston pin.
3 Measure 17.8-18.2 mm (0.7008-0.7165 in.) above the bottom of the piston skirt at right angles to the piston pin.
4 Measure 29.8-30.2 mm (1.1732-1.1890 in.) above the bottom of the piston skirt at right angles to the piston pin.
### Intake Valve Stem O.D.

**New**
- CH270: 5.50 mm (0.217 in.)
- CH395, CH440: 6.57 mm (0.259 in.)

**Max. Wear Limit**
- CH270: 5.34 mm (0.210 in.)
- CH395, CH440: 6.40 mm (0.252 in.)

### Exhaust Valve Stem O.D.

**New**
- CH270: 5.438 mm (0.214 in.)
- CH395, CH440: 6.55 mm (0.258 in.)

**Max. Wear Limit**
- CH270: 5.28 mm (0.208 in.)
- CH395, CH440: 6.41 mm (0.252 in.)

### Intake Valve Stem to Guide

**New**
- CH270: 0.024/0.039 mm (0.0009/0.0015 in.)
- CH395, CH440: 0.025/0.055 mm (0.0010/0.0022 in.)

**Max. Wear Limit**
- CH270: 0.10 mm (0.0039 in.)
- CH395, CH440: 0.13 mm (0.0051 in.)

### Exhaust Valve Stem to Guide

**New**
- CH270: 0.098/0.112 mm (0.0038/0.0044 in.)
- CH395, CH440: 0.040/0.070 mm (0.0016/0.0028 in.)

**Max. Wear Limit**
- CH270: 0.12 mm (0.0047 in.)
- CH395, CH440: 0.10 mm (0.0039 in.)

### Valve Guide Reamer Size

**Standard Intake**
- CH270: 5.524 mm (0.2175 in.)
- CH395, CH440: 6.608 mm (0.2602 in.)

**Standard Exhaust**
- CH270: 5.536 mm (0.2179 in.)
- CH395, CH440: 6.608 mm (0.2602 in.)

### Valve Seat Width

- CH270: 0.80 mm (0.0315 in.)
- CH395: 1.10 mm (0.0433 in.)
- CH440: 1.20 mm (0.0472 in.)

### Nominal Valve Face Angle

- 45°
### General Torque Values

**Metric Fastener Torque Recommendations for Standard Applications**

### Torque Conversions

- N·m = in. lb. x 0.113
- N·m = ft. lb. x 1.356
- in. lb. = N·m x 8.85
- ft. lb. = N·m x 0.737
Section 2
Tools & Aids

Certain quality tools are designed to help you perform specific disassembly, repair, and reassembly procedures. By using tools designed for the job, you can properly service engines easier, faster, and safer! In addition, you’ll increase your service capabilities and customer satisfaction by decreasing engine downtime.

Here is the list of tools and their source.

Separate Tool Suppliers:
Kohler Tools

Special Tools You Can Make

Rocker Arm/Crankshaft Tool
A spanner wrench to lift the rocker arms or turn the crankshaft may be made out of an old junk connecting rod.

1. Find a used connecting rod from a 10 HP or larger engine. Remove and discard the rod cap.

2. Remove the studs of a Posi-Lock rod or grind off the aligning steps of a Command rod, so the joint surface is flat.

3. Find a 1 in. long capscrew with the correct thread size to match the threads in the connecting rod.

4. Use a flat washer with the correct I.D. to slip on the capscrew and approximately 1 in. O.D. (Kohler Part No. 12 468 05-S). Assemble the capscrew and washer to the joint surface of the rod, as shown in Figure 2-1.

Figure 2-1. Rocker Arm/Crankshaft Tool.
Troubleshooting Guide

When troubles occur, be sure to check the simple causes which, at first, may seem too obvious to be considered. For example, a starting problem could be caused by an empty fuel tank.

Some general common causes of engine troubles are listed below. Use these to locate the causing factors. Refer to the specific section(s) within this service manual for more detailed information.

Engine Cranks But Will Not Start
1. Empty fuel tank.
2. Fuel shut-off valve closed.
3. Poor fuel, dirt or water in the fuel system.
4. Clogged fuel line.
5. Spark plug lead disconnected.
7. Faulty spark plug.
8. Faulty ignition module.
9. Low oil level.
10. Flywheel key sheared.

Engine Starts But Does Not Keep Running
1. Restricted fuel tank cap vent.
2. Poor fuel, dirt or water in the fuel system.
3. Faulty or misadjusted choke or throttle controls.
4. Loose wires or connections that short the kill terminal of ignition module to ground.
5. Faulty cylinder head gasket.
6. Faulty carburetor.
7. Intake system leak.
8. Low oil level.

Engine Starts Hard
1. PTO drive is engaged.
2. Dirt or water in the fuel system.
3. Clogged fuel line.
4. Loose or faulty wires or connections.
5. Faulty or misadjusted choke or throttle controls.
6. Faulty spark plug.
7. Low compression.
8. Weak spark.
10. Quality of fuel.
11. Flywheel key sheared.
12. Intake system leak.

Engine Will Not Crank
1. PTO drive is engaged.
2. Battery (if equipped) is discharged.
3. Faulty electric starter or solenoid (electric start).
4. Pawls not engaging in drive cup (retractable start).
5. Seized internal engine components.

Engine Runs But Misses
1. Dirt or water in the fuel system.
2. Spark plug lead loose.
3. Poor quality of fuel.
4. Faulty spark plug.
5. Loose wires or connections that intermittently ground the ignition kill circuit.
7. Faulty ignition module or incorrect air gap.
8. Carburetor adjusted incorrectly.

Engine Will Not Idle
1. Dirt or water in the fuel system.
2. Stale fuel and/or gum in carburetor.
3. Faulty spark plug.
4. Fuel supply inadequate.
5. Idle fuel adjusting needle improperly set.
7. Low compression.
8. Restricted fuel tank cap vent.
Section 3
Troubleshooting

Engine Overheats
1. Air intake/grass screen, cooling fins, or cooling shrouds clogged.
2. Excessive engine load.
3. Low crankcase oil level.
4. High crankcase oil level.
5. Faulty carburetor.

Engine Knocks
1. Excessive engine load.
2. Low crankcase oil level.
3. Old or improper fuel.
4. Internal wear or damage.
5. Poor quality fuel.
6. Incorrect grade of oil.

Engine Loses Power
1. Low crankcase oil level.
2. High crankcase oil level.
3. Dirty air cleaner element.
4. Dirt or water in the fuel system.
5. Excessive engine load.
7. Faulty spark plug.
8. Low compression.
10. Incorrect governor setting.

Engine Uses Excessive Amount of Oil
1. Incorrect oil viscosity/type.
2. Clogged, broken or inoperative crankcase breather.
3. Worn or broken piston rings.
4. Worn cylinder bore.
5. Worn valve stems/valve guides.
6. Crankcase overfilled.

Oil Leaks from Oil Seals, Gaskets
1. Clogged, broken or inoperative crankcase breather.
2. Loose or improperly torqued fasteners.
3. Piston blowby, or leaky valves.
4. Restricted exhaust.

External Engine Inspection
Before cleaning or disassembling the engine, make a thorough inspection of its external appearance and condition. This inspection can give clues to what might be found inside the engine (and the cause) when it is disassembled.

- Check for buildup of dirt and debris on the crankcase, cooling fins, grass screen, and other external surfaces. Dirt or debris on these areas are causes of higher operating temperatures and overheating.

- Check for obvious fuel and oil leaks, and damaged components. Excessive oil leakage can indicate a clogged breather, worn/damaged seals and gaskets, or loose or improperly-torqued fasteners.

- Check the air cleaner cover and base for damage or indications of improper fit and seal.

- Check the air cleaner element. Look for holes, tears, cracked or damaged sealing surfaces, or other damage that could allow unfiltered air into the engine. Also note if the element is dirty or clogged. These could indicate that the engine has been under serviced.

- Check the carburetor throat for dirt. Dirt in the throat is further indication that the air cleaner is not functioning properly.

- Check the oil level. Note if the oil level is within the operating range on the dipstick, or if it is low or overfilled.

- Check the condition of the oil. Drain the oil into a container - the oil should flow freely. Check for metal chips and other foreign particles.

Sludge is a natural by-product of combustion; a small accumulation is normal. Excessive sludge formation could indicate overrich carburetion, weak ignition, overextended oil change intervals or wrong weight or type of oil was used, to name a few.

NOTE: It is good practice to drain oil at a location away from the workbench. Be sure to allow ample time for complete drainage.
Cleaning the Engine
After inspecting the external condition of the engine, clean the engine thoroughly before disassembling it. Also clean individual components as the engine is disassembled. Only clean parts can be accurately inspected and gauged for wear or damage. There are many commercially available cleaners that will quickly remove grease, oil, and grime from engine parts. When such a cleaner is used, follow the manufacturer’s instructions and safety precautions carefully.

Make sure all traces of the cleaner are removed before the engine is reassembled and placed into operation. Even small amounts of these cleaners can quickly break down the lubricating properties of engine oil.

Basic Engine Tests

Crankcase Vacuum Test
A partial vacuum should be present in the crankcase when the engine is operating. Pressure in the crankcase (normally caused by a clogged or improperly assembled breather) can cause oil to be forced out at oil seals, gaskets, or other available spots.

Crankcase vacuum is best measured with either a water manometer or a vacuum gauge (see Section 2). Complete instructions are provided in the kits.

To test the crankcase vacuum with the manometer:

1. Insert the stopper/hose into the oil fill hole. Leave the other tube of manometer open to atmosphere. Make sure the shut-off clamp is closed.

2. Start the engine and run at no-load high speed (3400-3600 RPM).

3. Open the clamp and note the water level in the tube.

   The level in the engine side should be a minimum of 10.16 cm (4.00 in.) above the level in the open side.

   If the level in the engine side is less than specified (low/no vacuum), or the level in the engine side is lower than the level in the open side (pressure), check for the conditions in the table below.

4. Close the shut-off clamp before stopping the engine.

To test the crankcase vacuum with the Vacuum/Pressure Gauge Kit (see Section 2):

1. Remove the dipstick or oil fill plug/cap.

2. Install the adapter into the oil fill/dipstick tube opening.

3. Push the barbed fitting on the gauge solidly into the hole in the adapter.

4. Start the engine and bring it up to operating speed (3400-3600 RPM or application specific).

5. Check the reading on the gauge. If the reading is to the left of “0” on the gauge, vacuum or negative pressure is indicated. If the reading is to the right of “0” on the gauge, positive pressure is present.

   Crankcase vacuum should be a minimum of 4 inches of water. If the reading is below the specification, or if pressure is present, check the table below for possible causes and remedies.

<table>
<thead>
<tr>
<th>Possible Cause</th>
<th>Solution</th>
</tr>
</thead>
<tbody>
<tr>
<td>Crankcase breather clogged or inoperative.</td>
<td>Replace valve cover and recheck pressure. Breather is integral part of valve cover and cannot be serviced separately.</td>
</tr>
<tr>
<td>Seals and/or gaskets leaking. Loose or improperly torqued fasteners.</td>
<td>Replace all worn or damaged seals and gaskets. Make sure all fasteners are tightened securely. Use appropriate torque values and sequences when necessary.</td>
</tr>
<tr>
<td>Piston blow by or leaky valves (confirm by compression or cylinder leakdown tests and inspecting components).</td>
<td>Recondition piston, rings, cylinder bore, valves, and valve guides.</td>
</tr>
<tr>
<td>Restricted exhaust.</td>
<td>Check exhaust screen/spark arrester. Clean or replace as needed. Repair or replace any other damaged/restricted muffler or exhaust system parts.</td>
</tr>
</tbody>
</table>
Section 3  
Troubleshooting

Compression Test  
A compression test is best performed on a warm engine. Clean any dirt or debris away from the base of the spark plug before removing it. Be sure the choke is off, and the throttle is wide open during the test. Compression should be at least 45 psi.

Cylinder Leakdown Test  
A cylinder leakdown test can be a valuable alternative to a compression test. By pressurizing the combustion chamber from an external air source, you can determine if the valves or rings are leaking and how badly.

The Cylinder Leakdown Tester (refer to Section 2) is a relatively simple, inexpensive leakdown tester for small engines. The tester includes a quick disconnect for attaching the adapter hose, and a holding tool.

Leakdown Test Instructions  
1. Run the engine for 3-5 minutes to warm it up.
2. Remove the spark plug and the air filter from engine.
3. Rotate the crankshaft until the piston (of cylinder being tested) is at top dead center of the compression stroke. Hold the engine in this position while testing. The holding tool supplied with the tester can be used if the PTO end of the crankshaft is accessible. Lock the holding tool onto the crankshaft. Install a 3/8 in. breaker bar into the hole/slot of the holding tool, so it is perpendicular to both the holding tool and crankshaft PTO.

If the flywheel end is more accessible, use a breaker bar and socket on the flywheel nut/screw to hold it in position. An assistant may be needed to hold the breaker bar during testing. If the engine is mounted in a piece of equipment, it may be possible to hold it by clamping or wedging a driven component. Just be certain that the engine cannot rotate off of TDC in either direction.

4. Install the adapter into the spark plug hole, but do not attach it to the tester at this time.
5. Connect an air source of at least 50 psi to the tester.
6. Turn the regulator knob in the increase direction (clockwise) until the gauge needle is in the yellow Set area at the low end of the scale.
7. Connect the tester quick-disconnect to the adapter hose while firmly holding the engine at TDC. Note the gauge reading and listen for escaping air at the carburetor intake, exhaust outlet, and crankcase breather.
8. Check the test results against the following table:

Leakdown Test Results  
Air escaping from crankcase breather .......................................................Rings or cylinder worn.
Air escaping from exhaust system .............................................................Defective exhaust valve/improper seating.
Air escaping from carburetor ......................................................................Defective intake valve/improper seating.
Gauge reading in Low (green) zone.............................................................Piston rings and cylinder in good condition.
Gauge reading in Moderate (yellow) zone ...............................................Engine is still usable, but there is some wear present. Customer should start planning for overhaul or replacement.
Gauge reading in High (red) zone .............................................................Rings and/or cylinder have considerable wear. Engine should be reconditioned or replaced.
Section 4
Air Cleaner and Air Intake System

Air Cleaner

General
These engines are equipped with one of two air cleaner configurations; the Quad-Clean™, a four-stage heavy-duty cyclonic air cleaner, or the low-profile air cleaner.

Quad-Clean™ Air Cleaner

General
These engines are equipped with a replaceable, high-density paper air cleaner element. Some engines are also equipped with a preoiled, foam precleaner which surrounds the paper element. See Figure 4-1. The system is CARB/EPA certified and the components should not be altered or modified in any way.

Service
Check the air cleaner daily or before starting the engine. Check for a buildup of dirt and debris around the air cleaner system. Keep this area clean. Also check for loose or damaged components. Replace all bent or damaged air cleaner components.

NOTE: Operating the engine with loose or damaged air cleaner components could allow unfiltered air into the engine causing premature wear and failure.

Service Precleaner (If Equipped)
Wash the precleaner every 50 hours of operation (more often under extremely dusty or dirty conditions).

1. Remove the air cleaner cover. Move the bails on the air cleaner cover down. Remove the latches from under the tabs of the air cleaner base. Lift and remove the air cleaner cover from the air cleaner base. See Figure 4-2.

2. Remove the precleaner from the paper element.

3. Wash the precleaner in warm water with detergent. Rinse the precleaner thoroughly until all traces of detergent are eliminated. Squeeze out excess water (do not wring). Allow the precleaner to air dry.
4. Lightly oil the precleaner with new engine oil. Squeeze the precleaner to evenly distribute the oil and remove any excess.

5. Reinstall the precleaner over the paper element.

6. Position the air cleaner cover.
   a. For Normal Operation conditions, see Figure 4-3.
   b. For Cold Weather Operation conditions, see Figure 4-4.

   NOTE: Running the engine in the Cold Weather Operation position of the air cleaner cover under normal conditions can damage the engine.

7. Reinstall and secure the air cleaner cover. Align the air cleaner cover latches with the tabs on the base. Place the latches under the tabs and lift up on the bails. See Figure 4-5.

---

**Service Paper Element**

Every 200 hours of operation (more often under extremely dusty or dirty conditions), replace the paper element.

1. Remove the air cleaner cover. Move the bails on the air cleaner cover down. Remove the latches from under the tabs of the air cleaner base. Lift and remove the air cleaner cover from the air cleaner base. Separate the precleaner from the element and service as outlined above. See Figures 4-1 and 4-2.
2. **Do not** wash the paper element or use pressurized air, as this will damage the element. Replace a dirty, bent, or damaged element with a genuine Kohler element. Handle new elements carefully; do not use if the sealing surfaces are bent or damaged.

3. When servicing the air cleaner, check the air cleaner base. Make sure it is secured and not bent or damaged. Check the air cleaner cover/housing for damage or improper fit. Replace all bent or damaged air cleaner components.

4. Slide the precleaner and paper element onto the air cleaner base. See Figure 4-1.

5. Position the air cleaner cover.
   a. For Normal Operation conditions, see Figure 4-3.
   b. For Cold Weather Operation conditions, see Figure 4-4.

   **NOTE:** Running the engine in the Cold Weather Operation position of the air cleaner cover under normal conditions can damage the engine.

6. Reinstall and secure the air cleaner cover. Align the air cleaner cover latches with the tabs on the base. Place the latches under the tabs and lift up on the bails. See Figure 4-5.

**Low-Profile Air Cleaner**

**General**
The low-profile air cleaner contains an oiled-foam element.

The low-profile air cleaner is shown in Figure 4-6. The system is CARB/EPA certified and the components should not be altered or modified in any way.

**Service**
Check the air cleaner daily or before starting the engine. Check for a buildup of dirt and debris around the air cleaner system. Keep this area clean. Also check for loose or damaged components. Replace all damaged air cleaner components.

**NOTE:** Operating the engine with loose or damaged air cleaner components could allow unfiltered air into the engine causing premature wear and failure.

Every 100 hours of operation, wash the foam air cleaner element (more often under extremely dusty, or dirty conditions). Every 300 hours of operation (more often under extremely dusty or dirty conditions), replace the foam element.

1. Remove the screw at the bottom of the air cleaner cover, and remove the cover. See Figure 4-7.

2. Remove the foam element from the air cleaner base. See Figure 4-8.
3. Wash the foam element in warm water with detergent. Rinse the element thoroughly until all traces of detergent are eliminated. Squeeze out all excess water (do not wring). Allow the element to air dry.

4. Lightly oil the precleaner with new engine oil. Squeeze the precleaner to evenly distribute the oil and remove any excess.

5. When servicing the foam air cleaner element, clean and check the air cleaner case and outer cover for damage, distortion, or an improper seal. Replace any components which are bent or damaged.

6. Install the element into the air cleaner base.

7. Reinstall the cover and secure with the screw.

NOTE: Do not operate engine without the air cleaner element; excessive piston and/or cylinder wear may result.

Air Intake/Cooling System
To ensure proper cooling, make sure the grass screen, cooling fan fins, and external surfaces of the engine are kept clean at all times.

Every 100 hours of operation (more often under extremely dusty, dirty conditions), remove the blower housing and other cooling shrouds. Clean the cooling fins and external surfaces as necessary. Make sure the cooling shrouds are reinstalled. See Figure 4-9.
Section 5
Fuel System and Governor

Description
This section covers the carbureted fuel systems used on these engines. The governor system is covered at the end of this section.

⚠️ WARNING: Explosive Fuel!
Gasoline is extremely flammable and its vapors can explode if ignited. Store gasoline only in approved containers, in well ventilated, unoccupied buildings, away from sparks or flames. Do not fill the fuel tank while the engine is hot or running, since spilled fuel could ignite if it comes in contact with hot parts or sparks from ignition. Do not start the engine near spilled fuel. Never use gasoline as a cleaning agent.

Fuel System Components
The typical carbureted fuel system and related components include the following:

- Fuel Tank
- Fuel Line
- Fuel Tank Fuel Filter
- In-line Fuel Filter
- Fuel Strainer Screen In Carburetor
- Carburetor

Operation
The fuel tank outlet is located above the carburetor inlet, allowing gravity to feed fuel through the in-line filter and fuel line to the carburetor.

Fuel then enters the carburetor through a fuel shut-off valve and a fine screen/sediment bowl, and then to the carburetor float bowl. Fuel is drawn into the carburetor body and is mixed with air. This fuel-air mixture is then burned in the engine combustion chamber.

Fuel Recommendations

General Recommendations
Purchase gasoline in small quantities and store in clean, approved containers. A container with a capacity of 2 gallons or less with a pouring spout is recommended. Such a container is easier to handle and helps eliminate spillage during refueling.

- Do not use gasoline left over from the previous season, to minimize gum deposits in your fuel system and to ensure easy starting.
- Do not add oil to the gasoline.
- Do not overfill the fuel tank. Leave room for the fuel to expand. See Figure 5-1.

![Figure 5-1. Maximum Fuel Level.](image)
Fuel Type
For best results use only clean, fresh, unlead gasoline with a pump sticker octane rating of 87 (R+M)/2 or higher. In countries using the Research Octane Number (RON), it should be 90 octane minimum. Leaded gasoline is not recommended and must not be used on EFI engines or on other models where exhaust emissions are regulated.

Gasoline/Alcohol blends
Gasohol (up to 10% ethyl alcohol, 90% unleaded gasoline by volume) is approved as a fuel for Kohler engines. Other gasoline/alcohol blends including E20 and E85 are not to be used and not approved. Any failures resulting from use of these fuels will not be warranted.

Gasoline/Ether blends
Methyl Tertiary Butyl Ether (MTBE) and unleaded gasoline blends (up to a maximum of 15% MTBE by volume) are approved as a fuel for Kohler engines. Other gasoline/ether blends are not approved.

Fuel Line
These engines use low permeation rated fuel lines, certified to comply with California and U.S. EPA evaporative emission requirements. Fuel lines that do not meet these requirements may not be used. Order replacement hose through a Kohler Service Center.

Fuel Filters

Fuel Tank Filter (If Equipped)
A serviceable fuel tank filter is located under the fuel tank cap, in the filler neck.

Daily or as required clean filter of any accumulation as follows:

1. Remove the fuel tank cap and filter. See Figure 5-2.

Fuel Valve
These engines are equipped with a fuel valve and integral screen filter located at the inlet of the carburetor. It controls and filters fuel flow from the tank to the carburetor.
Section 5
Fuel System and Governor

NOTE: Models with a low-profile air cleaner do not have the fuel valve.

Every 100 hours of operation clean fuel valve cup of any accumulated debris. If the screen becomes clogged or damaged replace it.

Gasoline is extremely flammable and its vapors can explode if ignited. Store gasoline only in approved containers, in well ventilated, unoccupied buildings, away from sparks or flames.

WARNING
Explosive Fuel can cause fires and severe burns.

1. Stop the engine.

2. Remove the securing hardware and the carburetor cover panel. See Figure 5-4.

Figure 5-4. Carburetor Cover Panel.

3. Turn the fuel valve lever to the OFF position.

4. Remove the fuel valve cup. See Figure 5-5.

Figure 5-5. Fuel Valve Cup, O-ring, and Screen.

5. Clean the fuel valve cup with solvent and wipe it off.

6. Check the O-ring, replace if damaged. Check the screen for blockage or damage, replace if necessary. The new screen must be located on the pick-up tube as shown in Figure 5-6.

Figure 5-6. Pick-up Tube and Screen Orientation.

7. Place the O-ring on the screen followed by the fuel valve cup. Rotate the fuel valve cup until it is finger tight. Turn with a wrench 1/2 to 3/4 turn. See Figure 5-6.

8. Turn the fuel valve to the ON position and check for leaks. If fuel valve cup leaks repeat Step 7.

9. Reinstall the carburetor cover panel, using the hardware removed in Step 2 to secure.
## Fuel System Tests

When the engine starts hard, or turns over but will not start, it is possible that the problem is in the fuel system. To find out if the fuel system is causing the problem, perform the following tests.

### Troubleshooting – Fuel System Related Causes

<table>
<thead>
<tr>
<th>Test</th>
<th>Conclusion</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Check the following:</td>
<td></td>
</tr>
<tr>
<td>a. Make sure the fuel tank contains clean, fresh, proper fuel.</td>
<td></td>
</tr>
<tr>
<td>b. Make sure the fuel tank cap vent is clean and unobstructed.</td>
<td></td>
</tr>
<tr>
<td>c. Make sure the fuel shut-off valve is open.</td>
<td></td>
</tr>
<tr>
<td>d. Make sure the fuel shut-off valve strainer, and in-line fuel</td>
<td></td>
</tr>
<tr>
<td>filter (if used) are clean and unobstructed.</td>
<td></td>
</tr>
<tr>
<td>2. Check for fuel in the combustion chamber.</td>
<td>2. If there is fuel at the tip of the spark plug, fuel is reaching the combustion chamber.</td>
</tr>
<tr>
<td>a. Disconnect and ground spark plug lead.</td>
<td></td>
</tr>
<tr>
<td>b. Close the choke on the carburetor.</td>
<td>If there is no fuel at the tip of the spark plug, check for fuel flow from the fuel tank (Test 3).</td>
</tr>
<tr>
<td>c. Crank the engine several times.</td>
<td></td>
</tr>
<tr>
<td>d. Remove the spark plug and check for fuel at the tip.</td>
<td></td>
</tr>
<tr>
<td>3. Check for fuel flow from the tank to the carburetor.</td>
<td>3. If fuel does flow from the line, proceed to Test 4.</td>
</tr>
<tr>
<td>a. Disconnect the fuel line from the inlet fitting of the</td>
<td></td>
</tr>
<tr>
<td>carburetor.</td>
<td>If fuel does not flow from the line, check the fuel tank vent, in-line filter threaded into tank, and fuel line. Correct any observed problem and reconnect the line.</td>
</tr>
<tr>
<td>b. Use an approved fuel container to catch fuel and hold the line below the bottom of the tank to observe fuel flow.</td>
<td></td>
</tr>
<tr>
<td>4. Check the operation of fuel shut-off valve.</td>
<td>4. If fuel does flow from the valve, check for dirt and water in sediment bowl and screen. Clean bowl and screen as needed. (Refer to the carburetor portions of this section.)</td>
</tr>
<tr>
<td>a. Remove the fuel sediment bowl under the inlet fitting of</td>
<td>If fuel does not flow from the valve, check for a clog in the fuel shut-off valve or inlet elbow.</td>
</tr>
<tr>
<td>carburetor.</td>
<td></td>
</tr>
<tr>
<td>b. Turn fuel shut-off valve ON and OFF and observe operation.</td>
<td></td>
</tr>
</tbody>
</table>

If the above tests/checks did not indicate a problem with fuel delivery or related systems, but the engine still does not start properly, refer to the following chart and check for a carburetor problem.
**Carburetor**

These engines are equipped with a fixed main jet carburetor. The carburetor is designed to deliver the correct fuel-to-air mixture to the engine under all operating conditions. The idle mixture is set at the factory and cannot be adjusted. The low idle fuel adjusting needle is also set at the factory and has a limiting cap. It normally does not need adjustment.

**Adjustments**

**General**

NOTE: Carburetor adjustments should be made only after the engine has warmed up.

NOTE: Certified engines have a limiter cap on the idle fuel adjusting needle. Adjustments can only be performed within the limits allowed by the cap.

**High-Altitude Operation**

Operating the engine with the wrong engine configuration at a given altitude may increase its emissions and decrease fuel efficiency and performance. To ensure correct engine operation at altitudes above 1219 meters (4000 ft), it may be necessary to have an authorized Kohler dealer install a special high altitude jet kit in the carburetor. If a high altitude kit has been installed, the engine must be reconverted to the original jet size, before it is operated at lower altitudes, or overheating and engine damage can result.

To obtain high altitude kit information or locate a dealer near you, call 1-800-544-2444 to find the names of the nearest Kohler Co. Service Centers or, access our web site at: www.kohlerengines.com and click on the “Service & Dealer Locator” located in the upper right hand corner. The service center will need your engine specification number which is found on your Engine ID Label.

---

### Troubleshooting - Carburetor Related Causes

<table>
<thead>
<tr>
<th>Condition</th>
<th>Possible Cause/Probable Remedy</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Engine starts hard, runs roughly or stalls at idle speed.</td>
<td>1. Low idle fuel mixture (some models)/speed improperly adjusted. Adjust the idle speed screw or the idle mixture screw.</td>
</tr>
</tbody>
</table>
| 2. Engine runs rich (indicated by black, sooty exhaust smoke, misfiring, loss of speed and power, governor hunting, or excessive throttle opening). | 2a. Clogged air cleaner. Clean or replace.  
  b. Choke partially closed during operation. Check the choke lever/linkage to ensure choke is operating properly.  
  c. Low idle fuel mixture is improperly adjusted. Adjust idle mixture screw.  
  d. Dirt under the fuel inlet needle. Remove needle; clean needle and seat and blow with compressed air.  
  e. Bowl vent or air bleeds plugged. Remove low idle fuel adjusting needle. Clean vent, ports, and air bleeds. Blow out all passages with compressed air.  
  f. Leaky, cracked or damaged float. Submerge float to check for leaks. |
| 3. Engine runs lean (indicated by misfiring, loss of speed and power, governor hunting or excessive throttle opening). | 3a. Intake air leak. Check if carburetor is loose or one of the intake gaskets is leaking.  
  b. Idle holes plugged; dirt in fuel delivery channels. Clean main fuel jet and all passages; blow out with compressed air. |
  b. Dirt under fuel inlet needle. See Remedy 2d.  
  c. Bowl vents plugged. Blow out with compressed air.  
  d. Carburetor bowl gasket leaks. Replace gasket. |
Section 5
Fuel System and Governor

Adjusting Low Idle Speed
1. Start the engine and run at half throttle for 5 to 10 minutes to warm up. The engine must be warm before making final settings.

2. Low Idle Speed Setting: Place the throttle in the idle or slow position. Set the low idle speed to 1800 RPM (± 150 RPM) by turning the low idle speed screw in or out. See Figure 5-7.

   NOTE: The actual low idle speed depends on the application. Refer to the equipment manufacturer’s recommendations. The low idle speed for basic engines is 1800 RPM (± 150 RPM).

Figure 5-7. Carburetor Adjustments.

3. High Idle Speed Setting: Set the high idle speed by turning the high idle speed screw in or out. See Figure 5-8. Do not exceed 3750 RPM.

   NOTE: The high idle speed is also specified by the equipment manufacturer. Set according to recommendations. The high idle speed for basic engines is 3600 RPM (± 150 RPM).

Figure 5-8. High Speed Screw.

Carburetor Servicing
If symptoms described in the carburetor troubleshooting guide indicate a problem within the carburetor, the following steps can be used to remove the carburetor from the engine and provide the necessary service.

Carburetor Removal
1. Remove the air cleaner cover, filter element with precleaner, the carburetor cover mounting screws, and hex flange nuts from the mounting stud(s). See Figure 5-9.

   NOTE: If the low-profile air cleaner is installed, remove the cover and element, remove the two hex flange nuts securing the base to the carburetor and one screw secured to the blower housing, and remove the base.

Figure 5-9. Removing Air Cleaner Assembly.
2. Disconnect the breather hose from the valve cover or air cleaner base. Remove the two nuts, the hex flange screw securing the base to the head, and air cleaner base from the mounting studs. See Figure 5-9.

3. Remove the gasket from the mounting studs.

4. Disconnect the fuel line from the carburetor inlet. Disconnect the choke link and spring at the carburetor end.

NOTE: After disconnecting the fuel line, pinching, clamping, or plugging the fuel line may be needed if the fuel tank is not empty.

5. Slide the carburetor off of the mounting studs while disconnecting the throttle link and dampening spring.

6. Inspect the carburetor to insulator gasket, insulator, and insulator to cylinder head gasket, and replace as needed. See Figure 5-10.

Disassembly/Overhaul
1. Clean the exterior surfaces of dirt or foreign material before disassembling the carburetor. Remove the center fuel bowl screw and carefully separate the fuel bowl from the carburetor. Transfer any remaining fuel into an approved container. Remove and discard the old O-ring(s).

2. Remove the float pin and lift out the old float and inlet needle. Discard all of the parts. The seat for the inlet needle is not serviceable, and should not be removed. See Figures 5-11 and 5-12.

3. Use an appropriate size flat screwdriver, and carefully remove the main jet from the carburetor. After the main jet has been removed, the main nozzle can be taken out through the bottom of the main tower. Save the parts for cleaning and reuse. See Figure 5-13.
Section 5
Fuel System and Governor

4. Remove the fuel shut-off fuel bowl, screen, and O-ring. See Figure 5-14.

NOTE: Models with a low-profile air cleaner will not have a fuel shut-off.

5. Remove the two screws, top plate, and fuel shut-off lever. See Figure 5-15.

6. Remove disc and wave washer. See Figure 5-16.

NOTE: The carburetor is now disassembled for appropriate cleaning and installation of the parts in the overhaul kit. Further disassembly is not necessary. The throttle shaft assembly, fuel inlet seat, and bowl chamber baffle, are non-serviceable items and should not be removed.

7. Clean the carburetor body, jets, vent ports, seats, etc., using a good commercially available carburetor solvent. Use clean, dry compressed air to blow out the internal channels and ports. Inspect and thoroughly check the carburetor for cracks, wear, or damage. Inspect the fuel inlet seat for wear or damage.

8. Clean the carburetor float bowl as required.

9. Install the fuel shut-off disc and wave washer into the chamber of the fuel shut-off. See Figure 5-16. Install the fuel shut-off lever and top plate, and secure with the two screws. See Figure 5-15.

10. Install the fuel shut-off screen and O-ring and install the bowl onto the fuel shut-off assembly. See Figure 5-14.

11. Install the main nozzle and the main jet into the tower of the carburetor body. See Figure 5-13.

12. Install the float and inlet needle down into the seat and carburetor body. Insert the new pivot pin through the float hinge. See Figure 5-12.
13. Hold the carburetor body so the float assembly hangs vertically and rests lightly against the fuel inlet needle. The inlet needle should be fully seated but the center pin of the needle (on retainer clip end) should not be depressed.

NOTE: The inlet needle center pin is spring loaded. Make sure the float assembly rests against the fuel inlet needle, without depressing the center pin.

14. Install the fuel bowl, with the O-ring(s) in place, onto the carburetor. Secure with O-ring on original screw. Torque the screw to 7.0 N·m (62 in. lb.).

Carburetor Installation
Always use new gaskets when servicing or reinstalling carburetors. Repair kits are available which include new gaskets and other components. Service kit part numbers can be found in our free online parts lookup Kohler PLUS. Go to www.kohlerplus.com and click Enter as a Guest.

1. Reverse the steps in Carburetor Removal to install the carburetor to the engine.

Governor
These engines are equipped with a centrifugal flyweight mechanical governor. The governor is designed to hold the engine speed constant under changing load conditions. The governor gear/flyweight mechanism is mounted inside the crankcase and driven off the gear on the crankshaft.

Operation
Centrifugal force acting on the rotating governor gear assembly causes the flyweights to move outward as speed increases. As the flyweights move outward, they cause the regulating pin to extend from the governor gear assembly. See Figure 5-17.

The regulating pin contacts the tab on the cross shaft, causing the shaft to rotate when the engine speed changes. One end of the cross shaft protrudes through the side of the closure plate. Through external linkage attached to the cross shaft, the rotating action is transmitted to the throttle lever of the carburetor. See Figure 5-18.

Figure 5-18. Typical Governor System.

When the engine is at rest, and the throttle control is in the FAST position, the tension of the governor spring holds the throttle plate open. When the engine is operating (the governor gear assembly is rotating), the force applied by the regulating pin against the cross shaft tends to close the throttle plate. The governor spring tension and the force applied by the regulating pin are in equilibrium during operation, holding the engine speed constant.

When a load is applied and the engine speed (and governor gear speed) decreases, the governor spring tension moves the governor lever to open the throttle plate wider. This allows more fuel into the engine, increasing engine speed (this action occurs very rapidly, so a reduction in speed is hardly noticed). As the speed reaches the governed setting, the governor spring tension and the force applied by the regulating pin will again be in equilibrium. This maintains the engine speed at a relatively constant level.

The governed speed setting is determined by the position of the throttle control. It can be variable or constant, depending on the application.

Figure 5-17. Action of a Governor Gear.
Section 5
Fuel System and Governor

Initial Adjustment
Make this initial adjustment whenever the governor lever is loosened or removed from the cross shaft. To ensure proper setting, make sure the throttle linkage is connected to the governor lever and to the carburetor throttle lever (certain engine components removed for clarity of illustration).

CH270
1. Close the fuel shut-off valve.

2. Remove the air cleaner outer cover. Then either reposition the fuel tank to access governor shaft and lever joint, or disconnect the fuel line and remove the tank from the engine.

NOTE: Make sure the carburetor is mounted and secured in place when adjustment is being made/checked.

3. Loosen the governor lever mounting nut. See Figure 5-19.

4. Move the governor lever clockwise until it stops.

5. Rotate the governor shaft clockwise until it stops.

6. Hold both in this position and tighten the governor lever nut to 12 N·m (106 in. lb.).

CH395, CH440
1. Close the fuel shut-off valve.

2. Remove the air cleaner outer cover. Then either reposition the fuel tank to access governor shaft and lever joint, or disconnect the fuel line and remove the tank from the engine.

3. Loosen the governor lever mounting nut. See Figure 5-20.

4. Move the governor lever counterclockwise until it stops.

5. Rotate the governor shaft counterclockwise until it stops.

6. Hold both in this position and tighten the governor lever nut to 12 N·m (106 in. lb.).

NOTE: Make sure the carburetor is mounted and secured in place when adjustment is being made/checked.

Figure 5-19. Governor Adjustment.

Figure 5-20. Governor Adjustment.
Section 6
Lubrication System

General
These engines use a splash lubrication system, supplying necessary lubrication to the crankshaft, camshaft, connecting rod and valve train components.

Oil Recommendations
Using the proper type and weight of oil in the crankcase is extremely important. So is checking oil daily and changing oil regularly. Failure to use the correct oil, or using dirty oil, causes premature engine wear and failure.

Oil Type
Use high quality detergent oil of API (American Petroleum Institute) service class SJ or higher. Select the viscosity based on the air temperature at the time of operation as shown in the following table. See Figure 6-1.

NOTE: Using other than service class SJ, or higher oil, or extending oil change intervals longer than recommended can cause engine damage.

A logo or symbol on oil containers identifies the API service class and SAE viscosity grade. See Figure 6-2.

![Figure 6-2. Oil Container Logo.](image)

The top portion of the symbol shows service class such as API SERVICE CLASS SJ. The symbol may show additional categories such as SH, SG/CC, or CD. The center portion shows the viscosity grade such as SAE 10W-30. If the bottom portion shows “Energy Conserving,” it means that oil is intended to improve fuel economy in passenger car engines.
Check Oil Level
The importance of checking and maintaining the proper oil level in the crankcase cannot be overemphasized. Check oil **BEFORE EACH USE** as follows:

1. Make sure the engine is stopped, level, and is cool so the oil has had time to drain into the sump.

2. Clean the area around and beneath the dipstick or the oil fill plug before removing it. This will help keep dirt, debris, and other foreign matter out of the engine. See Figure 6-3.

3. **Checking oil level with a dipstick.** Unscrew and remove the dipstick; wipe off oil. Reinsert the dipstick into the oil fill tube and rest the dipstick on the oil fill tube. Turn it counterclockwise until the cap drops down to the lowest point of the thread leads. **Do not** thread the dipstick cap into the tube. See Figure 6-5.

![Figure 6-5. Dipstick Oil Level Check.](image)

Checking oil level with an oil fill plug. Unscrew and remove the oil fill plug. The level should be up to but not over, the point of overflowing the filler neck. See Figure 6-6.

![Figure 6-6. Oil Fill Plug Oil Level Check.](image)

4. If the level is low, add oil of the proper type (Refer to Oil Type) to the correct level. Always check the level before adding more oil. See Figures 6-5 and 6-6.

**NOTE:** To prevent extensive engine wear or damage, always maintain the proper oil level in the crankcase. Never operate the engine with the oil level above or below the correct level.
Oil Disposal
Protect and respect the environment. Dispose of oil at your local recycling center or municipal collection center in accordance with local ordinances.

Change Oil
For a new engine, change oil after the first 5 hours of operation. Thereafter, change oil every 100 hours of operation.

For an overhauled engine, use Kohler 10W-30 service class, SJ or higher oil for the first 5 hours of operation. Change the oil after this initial run-in period. Refill with service class SJ or higher oil as specified in the Viscosity Grades table (see Figure 6-1).

Change the oil while the engine is still warm. The oil will flow more freely and carry away more impurities. Make sure the engine is level when filling, checking, or changing the oil.

Change the oil as follows:

1. To keep dirt, debris, etc., out of the engine, clean the area around the oil fill plug/dipstick before removing it. See Figure 6-7.

2. Remove the oil drain plug and the dipstick/oil fill plug. Allow ample time for complete drainage.

3. Reinstall the drain plug and torque to:
   CH270 18 N·m (159 in. lb.).
   CH395, CH440 23 N·m (204 in. lb.).

4. Fill the crankcase, with new oil of the proper type, up to the point of overflowing the filler neck. Refer to Oil Type. Always check the level before adding more oil.

5. Reinstall the dipstick/oil fill plug and tighten securely. See Figure 6-8.

NOTE: Over tightening the dipstick/oil fill plug will distort the gasket and may cause oil weeping.

Oil Sentry™
Some engines are equipped with an optional Oil Sentry™ switch. This switch is designed to prevent the engine from starting in a low oil or no oil condition. The Oil Sentry™ may not shut down a running engine before damage occurs. In some applications this switch may activate a warning signal. Read your equipment manuals for more information.
Section 7
Retractable Starter

WARNING: Spring Under Tension!
Retractable starters contain a powerful, recoil spring that is under tension. Always wear safety goggles when servicing retractable starters and carefully follow instructions in this section for relieving spring tension.

Figure 7-1. Retractable Starter - Exploded View.

To Remove Starter
1. Remove the three hex flange screws securing the starter assembly to the blower housing.
2. Remove the starter assembly.

To Install Starter
1. Align the retractable starter with the mounting locations on the blower housing, and install the hex flange screws. Leave the screws slightly loose. See Figure 7-2.

Figure 7-2. Installing Retractable Starter.
Section 7
Retractable Starter

2. Pull the starter handle out until the pawls engage the drive cup. Hold the handle in this position and torque the screws to 5.4 N·m (48 in. lb.).

Rope Replacement
The rope can be replaced without complete starter disassembly.

1. Remove the starter from the engine blower housing.

2. Pull the rope out approximately 12 in. and tie a temporary (slip) knot in it to keep it from retracting into the starter. See Figure 7-3.

3. Pull the knot end out of the handle, untie the knot, and slide the handle off.

4. Hold the pulley firmly and untie the slip knot. Allow the pulley to rotate slowly as the spring tension is released.

5. When all spring tension on the starter pulley is released, remove the rope from the pulley.

6. Tie a double left-hand knot in one end of the new rope. See Figure 7-4.

7. Rotate the pulley counterclockwise to pre-tension the spring (approximately 4 full turns of pulley).

8. Rotate the pulley until the rope hole in the pulley is aligned with the rope guide bushing of the starter housing.

NOTE: Do not allow the pulley/spring to unwind. Enlist the aid of a helper if necessary.

9. Feed the unknotted end of the rope through the rope hole in the starter pulley and rope guide bushing of the housing. See Figure 7-5.

10. Tie a slip knot approximately 12 in. from the free end of the rope. Hold the pulley firmly and allow it to rotate slowly until the slip knot reaches the guide bushing of the housing.
11. Slip the handle onto the rope. Tie a double left-hand knot at the end of the rope. See Figure 7-6.

![Figure 7-6. Handle Left-hand Knot.](image)

12. Untie the slip knot and pull on the handle until the rope is fully extended. Slowly retract the rope into the starter. If the spring is properly tensioned, the rope will retract fully and the handle will stop against the starter housing.

### Pawl (Dogs) Replacement

Only partial disassembly of the starter is necessary to replace the pawls. Pawl repair kits are available which include the following components:

<table>
<thead>
<tr>
<th>Pawl Repair Kit</th>
<th>Qty</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pawl Spring</td>
<td>2</td>
<td>Pawl (Dog) Spring</td>
</tr>
<tr>
<td>Pawl Dog</td>
<td>2</td>
<td>Starter Pawl (Dog)</td>
</tr>
</tbody>
</table>

### Disassembly

**WARNING: Spring Under Tension!**

Do not remove the center screw from starter until the spring tension is released. Removing the center screw before releasing spring tension, or improper starter disassembly, can cause the sudden and potentially dangerous release of the spring. Follow these instructions carefully to ensure personal safety and proper starter disassembly. Make sure adequate face protection is worn by all persons in the area.

1. Release coil spring tension by loosening the center screw approximately 1 turn. Rotate the pulley against spring tension until the pulley rope hole with knot is adjacent to outlet in housing. Lift up the slack in the rope between the pulley and the housing, slowly allow the pulley to unwind, releasing the spring tension. Count the number of rotations for reassembly later.

2. Unscrew the center screw and lift off the drive plate. The center screw will be captured by the clip around the shoulder on the backside of the plate.

3. Note the positions of the pawls and pawl springs before removing. Remove parts from pulley.

4. Carefully inspect the components for wear, cracks, and/or damage. Replace all worn or damaged components. Use only genuine Kohler replacement parts. Refer to our free online parts lookup system www.kohlerplus.com for the available service parts.

5. Install pawl springs and pawls onto pawl studs of pulley. All parts must be dry. See Figure 7-7.

![Figure 7-7. Drive Plate and Pawl Details.](image)

6. Position the drive plate over the pawls, aligning the actuating slots in the plate with the raised sections on each drive pawl. Torque the center screw to 10 N-m (89 in. lb.). Rotate the pulley by hand and check operation. See Figure 7-8.
7. Rehook the slack in the rope into the notch of the pulley and rotate the pulley counterclockwise (viewed from pawl side) to re-tension the spring (approximately 4 full turns).
Section 8
Electrical System and Components

This section covers the operation, service, and repair of the electrical system components. Systems and components covered in this section are:

- Spark Plugs
- Electronic Ignition System
- Battery and Charging System
- Electric Starter

Oil Sentry™ Control System
Some engines are equipped with an optional Oil Sentry™ switch. This switch is designed to prevent the engine from starting in a low oil or no oil condition. The Oil Sentry™ may not shut down a running engine before damage occurs. In some applications this switch may activate a warning signal. Read your equipment manuals for more information.

Spark Plugs
Engine misfire or starting problems are often caused by a spark plug that has improper gap or is in poor condition.

The engine is equipped with the following spark plugs:

**Type:** The standard spark plug is a Champion® RC12YC. Equivalent alternate brand plugs can also be used.

- **Gap:** 0.76 mm (0.030 in.)
- **Thread Size:** 14 mm
- **Reach:** 19.1 mm (3/4 in.)
- **Hex Size:** 15.9 mm (5/8 in.)

Spark Plug Service
Every 100 hours of operation, remove the spark plug, check its condition and reset the gap, or replace it with a new plug as necessary. To service the plugs, perform the following steps:

1. Before removing the spark plug, clean the area around the base of the plug to keep dirt and debris out of the engine.

2. Remove the plug and check its condition. See Inspection following this procedure. Replace the plug if necessary.

   **NOTE:** Do not clean spark plug in a machine using abrasive grit. Some grit could remain in the spark plug and enter the engine causing extensive wear and damage.

3. Check the gap using a wire feeler gauge. Adjust the gap to 0.76 mm (0.030 in.) by carefully bending the ground electrode. See Figure 8-1.

4. Reinstall the spark plug into the cylinder head and torque to 22-27 N·m (195-239 in. lb.).

Figure 8-1. Servicing Spark Plug.
Section 8
Electrical System and Components

Inspection
Inspect the spark plug when it is removed from the cylinder head. The deposits on the tip are an indication of the general condition of the piston rings, valves, and carburetor.

Normal and fouled plugs are shown in the following photos:

Normal: A plug taken from an engine operating under normal conditions will have light tan or gray colored deposits. If the center electrode is not worn, a plug in this condition could be set to the proper gap and reused.

Worn: On a worn plug, the center electrode will be rounded and the gap will be greater than the specified gap. Replace a worn spark plug immediately.

Carbon Fouled: Soft, sooty, black deposits indicate incomplete combustion caused by a restricted air cleaner, over rich carburetion, weak ignition, or poor compression.

Wet Fouled: A wet plug is caused by excess fuel or oil in the combustion chamber. Excess fuel could be caused by a restricted air cleaner, a carburetor problem, or operating the engine with too much choke. Oil in the combustion chamber is usually caused by a restricted air cleaner, a breather problem, or internal engine wear.

Overheated: Chalky, white deposits indicate very high combustion temperatures. This condition is usually accompanied by excessive gap erosion. Lean carburetor settings, an intake air leak, or incorrect spark timing are normal causes for high combustion temperatures.
Electronic Ignition System

These engines are equipped with a dependable magneto breakerless ignition. In such a system, electrical energy is generated by the cutting of magnetic flux lines generated from the ignition magnet on the engine flywheel via the prescribed air gap as it passes the ignition module. This energy is transferred through the ignition module laminations and is then converted in the module electronics and stored in the module primary coil, as a current if it is an inductive discharge ignition (IDI) module, or as a voltage in a capacitor if it is a capacitive discharge ignition (CDI) module. The stored energy is transferred at the correct moment by triggering a semiconductor switch inside the module. The electrical break by the switch initiates the energy transfer by causing the collapse of the magnetic field at the coil primary. This includes a voltage at the coil primary that is amplified via transformer action at the coil secondary. The amplitude of the voltage at the coil secondary is sufficient to jump the gap at the spark plug, igniting the fuel air mixture in the gap and initiating combustion. Note that by design, these modules only will provide proper function if mounted in the correct orientation.

This system consists of the following components (see Figure 8-2):
- Magnets permanently affixed to the flywheel.
- Inductive discharge ignition module (IDI) mounted on the engine crankcase.
  - Includes a shut down (kill) terminal mounted at the side of the module.
  - Includes a secondary lead wire from the coil to a terminal inside a spark plug boot.
- External switch that connects to the shut down terminal and grounds the module to stop the engine.

Figure 8-2. Inductive Discharge Ignition System.

Troubleshooting and Testing Ignition

Ignition and Oil Sentry™ Systems

Ignition problems are most often due to poor or loose connections, or connections that keep the shut down terminal shorted to ground preventing proper ignition operation.

Before beginning any test procedures, be certain all module terminal connections are correct and fit snugly. Make certain the shut down lead is not shorted to ground when the engine is attempting to crank or run. Proper ignition module air gap to the flywheel magnet must be maintained for best performance. Ensure crankcase oil is at the proper level. Refer to Section 6.
These modules are designed to be trouble free for the life of the engine. Other than periodic checking or replacing of the spark plug, no maintenance is required. The ignition module automatically controls the timing of the spark.

Mechanical systems do occasionally fail or break down, the following troubleshooting information is provided to help systematically determine the cause of a reported problem.

<table>

Section 8
Electrical System and Components

Battery Charging Systems

General
These engines may be equipped with a 3 amp, 4 amp, 10 amp or 18 amp regulated battery charging system. Refer to the appropriate wiring diagram for troubleshooting and servicing your system.

Figure 8-5. Wiring Diagram, Retractable Starter.

Figure 8-6. Wiring Diagram-3/4 Amp Charging System, Rectified Only.
Section 8
Electrical System and Components

NOTE: Observe the following guidelines to avoid damage to the electrical system and components.

- Make sure the battery polarity is correct. A negative (−) ground system is used.
- Make sure all ground connections are secure and in good condition.
- Disconnect both battery cables before doing electrical welding on the equipment powered by the engine. Also, disconnect other electrical accessories in common ground with the engine.
- Prevent the stator (AC) leads from touching or shorting while the engine is running. This can damage the stator.

Stator
The stator is mounted on the crankcase behind the flywheel. Should the stator have to be replaced, follow the procedures in Section 9 Disassembly.

Rectifier-Regulator
The rectifier-regulator is connected to the engine with a matching wiring harness containing a plug-in connector. Grounded through the wiring harness, the rectifier-regulator is secured to the equipment in a suitable location with two mounting screws. To replace it, disconnect the plug, and remove the two mounting screws.

NOTE: When installing the rectifier-regulator, push the wiring harness plug into the regulator receptacle until it locks into place.

The rectifier-regulator converts the AC voltage coming from the stator to DC voltage, while also monitoring and controlling the battery voltage. There are two different rectifier-regulators which are used; an 18 amp and a 10 amp assembly. Although externally similar, the internal circuits differ and the two should not be interchanged. See Figures 8-8 and 8-9.
Rectified Only (Non-Regulated) Systems
Some engines are equipped with a rectified only, non-regulated charging system, with output ranging from 3 amps to 4 amps. The rectifier is normally connected to the engine with a matching wiring harness and secured inside the control panel. Grounding is achieved through the wiring harness. The rectifier converts AC voltage coming from the stator to DC voltage only.

Troubleshooting Guide

Battery Charging System
NOTE: Zero ohmmeters on each scale to ensure accurate readings. Voltage tests should be made with engine running at 3600 RPM - no load. Battery must be fully charged. Check the specific gravity of battery. If low, recharge or replace battery as necessary.
<table>
<thead>
<tr>
<th>Problem</th>
<th>Test</th>
<th>Conclusion</th>
</tr>
</thead>
</table>
| No Charge to Battery          | 1. Refer to Figure 8-10. Separate the bullet connector in the white lead from the rectifier-regulator. Connect an ammeter from the female terminal to the positive (+) terminal of the battery. Connect a DC voltmeter from the female terminal to the negative (-) terminal of the battery. Leave the other rectifier-regulator leads connected in the normal manner. Run the engine at 3600 RPM and read the voltage on the voltmeter.  
If voltage is 14.0 volts or more, place a minimum load of 5 amps* on battery to reduce voltage. Observe ammeter.  
*NOTE: Turn on lights (if 60 watts or more) or place a 2.5 ohm, 100 watt resistor across battery terminals. | 1. If voltage is 14.0-15.0 volts and charge rate increases when load is applied, the charging system is OK and the battery was fully charged.  
If voltage is less than 14.0 volts or charge rate does not increase when load is applied, test stator (Tests 2 and 3). |
|                               | 2. Separate the bullet connectors in the AC (white) leads. Connect an AC voltmeter across the stator leads (female terminals). With engine running at 3600 RPM, measure the AC output from the stator. | 2. If voltage is 20.0 volts or more, stator is OK. Rectifier-regulator is faulty. Replace the rectifier-regulator.  
If voltage is less than 20.0 volts, stator is probably faulty and should be replaced. Test stator further using an ohmmeter (Test 3). |
|                               | 3. With the engine stopped, measure the resistance from each stator lead to ground using an ohmmeter. | 3. If the resistance is infinity ohms (no continuity), the stator is OK (not shorted to ground).  
If resistance (or continuity) is measured, the stator leads are shorted to ground. Replace stator. |
| Battery Continuously Charges at High Rate | 1. Perform same test as Step 1 above. | 1. If the voltage is 15.0 volts or less the charging system is OK. The battery is unable to hold a charge. Service or replace battery as necessary.  
If voltage is more than 15.0 volts, the rectifier-regulator is faulty. Replace the rectifier-regulator. |
Battery

General
A 12 volt battery (not furnished) with a minimum current rating of 230 cold cranking amps/18 amp hours should be sufficient for cranking most electric start engine models. The actual cold cranking requirement depends on engine size, application and starting temperatures. Cranking requirements increase as temperatures decrease and battery capacity shrinks. Refer to the operating instructions of the equipment this engine powers for specific battery requirements.

If the battery charge is not sufficient to turn over the engine, recharge the battery.

Electric Starting Motors
Electric start engines in this series use an inertia drive starter.

Starting Motor Precautions
NOTE: Do not crank the engine continuously for more than 10 seconds at a time. If the engine does not start, allow a 60 second cool-down period between starting attempts. Release the switch as soon as the engine starts. Failure to follow these guidelines can burn out the starter motor.

NOTE: If the engine develops sufficient speed to disengage the starter but does not keep running (a false start), the engine rotation must be allowed to come to a complete stop before attempting to restart the engine. If the starter is engages while the flywheel is rotating, the starter pinion and flywheel ring gear may clash, resulting in damage of the starter.

NOTE: If the starter does not crank the engine, shut off the starter immediately. Check the condition of the inline fuse and do not make further attempts to start the engine until the condition is corrected.

NOTE: Do not drop the starter or strike the starter housing. Doing so can damage the starter.

Troubleshooting Guide – Starting Difficulties

<th>Problem</th>
<th>Test</th>
<th>Conclusion</th>
</tr>
</thead>
</table>
| 1. Test battery on unit.  
   a. Connect a DC voltmeter across the battery terminals and read battery voltage (key switch OFF).  
   b. Turn key switch to start position and read battery voltage again. Turn switch OFF. | 1. a. Battery voltage should be at least **12 volts**. If low charge battery.  
   b. Battery voltage should not fall below **9 volts** during cranking. If it does, battery may be faulty or there may be a short in the starting circuit. Have battery load tested. If battery passes load test, check circuitry. | |
| 2. Remove the electric starter cover panel and check the fuse inside the plastic holder. The fuse outside the holder is a spare. | 2. If fuse is blown, check for a wiring problem (bare wire, short circuit). Correct problem and replace fuse. Try to start engine. If it still won't start, go to Step 3. | |
| 3. Disconnect the blue relay lead. Be sure transmission is in neutral and PTO is OFF. Connect one end of a jumper lead to the positive terminal of the battery. Connect the other end to the terminal of the relay.  
   4. Use a known, good, fully-charged battery and jumper cables to test starter motor. Be sure the transmission is in neutral and PTO is OFF. Remove the heavy lead from the post terminal on the starter. Connect one end of the positive jumper cable to the post terminal and connect the other end to the positive terminal of the battery. Connect one end of the negative jumper cable to the negative terminal of the battery. Touch the other end of the negative jumper cable to a bare surface on the crankcase or to the starter housing.  
   5. Disconnect the leads from the starter relay and remove it from the starter for testing.  
   a. Set an ohmmeter on the Rx1 scale and zero the meter. Connect one ohmmeter lead to the terminal of the blue lead from the relay. Connect the other ohmmeter lead to the relay mounting bracket.  
   b. With the ohmmeter still on the Rx1 scale, connect the leads to the two large post terminals.  
   c. Leave the ohmmeter leads connected to the large terminals. Connect a jumper lead from the positive terminal of the battery to the terminal of the blue relay lead. Connect another jumper lead from the negative terminal of the battery to the relay mounting bracket. | 3. If relay engages and starter begins to crank, the key switch is faulty, or there is a wiring problem to/from the key switch. Check wiring and test key switch circuits with an ohmmeter.  
   4. When negative jumper cable is touched to crankcase or starter housing, starter motor should operate. If it does, continue with Step 5. If starter does not operate, refer to the servicing procedures for the starter motor. Repair or replace as required.  
   5. a. The resistance of the energizing coil should be at least 3.4 ohms. If the meter reading is less than 3.4 ohms, or an open circuit is indicated (infinity ohms), the relay is faulty and must be replaced.  
   b. The meter should indicate an open circuit (infinity ohms, no continuity).  
   c. When the circuit is completed, applying **12 volts** to the energizing coil, an audible click should be heard as the relay engages, and the ohmmeter should then indicate continuity between the large terminals. If the results are other than indicated, replace the relay. |
Section 8
Electrical System and Components

Starter Removal and Installation
Refer to the Disassembly and Reassembly sections for starter removal and installation procedures.

Operation
When power is applied to the starter, the armature rotates. As the armature rotates, the drive pinion moves out on the splined drive shaft and into mesh with the flywheel ring gear. When the pinion reaches the end of the drive shaft, it rotates the flywheel and cranks the engine. When the engine starts, the flywheel rotates faster than the starter armature and drive pinion. This moves the drive pinion out of mesh with the ring gear and into the retracted position. When power is removed from the starter, the armature stops rotating and the drive pinion is held in the retracted position by the anti-drift spring.

Starter Drive Service
Every 200 hours of operation (or annually, whichever occurs first), clean and lubricate the geartrain. If the gears are worn, or have chipped or broken teeth, the starter must be replaced.

It is not necessary to completely dissemble the starter to service the geartrain. Service the starter as follows:

1. Remove the starter from the engine.
2. Remove the housing screws and the drive end cap screw. See Figure 8-11.
3. Remove the drive end cap. The drive pinion will either remain in the geartrain or come out with the drive end cap. See Figure 8-12.
4. Remove the drive pinion and dust cover, exposing the geartrain. See Figure 8-13.
5. Inspect the gears for damage or wear.
6. Clean the gears as required.
7. Apply a small amount of Kohler electric starter drive lubricant, (see Section 2) to the geartrain. See Figure 8-14.
8. Reinstall the dust cover and insert the drive pinion into the geartrain. See Figure 8-15.

![Figure 8-15. Reinstall Dust Cover and Drive Pinion.](image)

9. Assemble the drive end cap onto the drive pinion. See Figure 8-16.

![Figure 8-16. Reinstall Drive End Cap.](image)

10. Reinstall and securely tighten the housing and drive end cap screws. See Figure 8-17.

![Figure 8-17. Reinstall Housing and Drive End Cap Screws.](image)
Section 9
Disassembly

General
Clean all parts thoroughly as the engine is disassembled. Only clean parts can be accurately inspected and gauged for wear or damage. There are many commercially available cleaners that will quickly remove grease, oil, and grime from engine parts. When such a cleaner is used, follow the manufacturer’s instructions and safety precautions carefully.

Make sure all traces of the cleaner are removed before the engine is reassembled and placed into operation. Even small amounts of these cleaners can quickly break down the lubricating properties of engine oil.

Typical Disassembly Sequence
The following sequence is suggested for complete engine disassembly. The sequence can be varied to accommodate options or special equipment.

1. Disconnect spark plug lead.
2. Turn fuel shut-off valve to OFF position.
3. Drain oil from crankcase.
4. Remove muffler and heat shield assembly.
5. Remove air cleaner assembly.
6. Remove fuel tank.
7. Remove external throttle, governor and choke linkage.
8. Remove carburetor.
9. Remove retractable starter.
10. Remove blower housing and shields.
11. Remove electrical wiring, micro shut down switch & bracket, and fuel tank brackets.
12. Remove control panel and electric starter.
13. Remove valve cover/breather, rocker arms, push rods and cylinder head assembly.
14. Remove valves.
15. Remove ignition module.
16. Remove flywheel.
17. Remove stator.
18. Remove closure plate.
20. Remove camshaft and valve tappets.
21. Remove piston, connecting rod, and crankshaft.
22. Remove Oil Sentry™ system.
23. Remove governor assembly.
24. Remove crankcase and closure plate seals and bearings.

Disconnect Spark Plug Lead
1. Disconnect the lead from the spark plug. See Figure 9-1.

NOTE: Pull on boot only, to prevent damage to spark plug lead.

Turn Fuel Shut-Off Valve to OFF Position
1. Push fuel shut-off lever to the left to close the fuel valve. See Figure 9-2.

---

Figure 9-1. Disconnect Spark Plug Lead.

Figure 9-2. Shut-Off Fuel Valve.
NOTE: Models with the low-profile air cleaner do not have the fuel shut-off valve. Instead, turn off the fuel at the fuel supply.

Drain Oil From Crankcase
1. Remove one of the oil drain plugs and one of the oil fill plugs. See Figure 9-3.

2. Allow ample time for the oil to drain from the crankcase.

Remove Muffler and Heat Shield Assembly
1. Remove the hex flange screws from the exhaust flange and muffler bracket. See Figures 9-4, 9-5, and 9-6.

2. Remove the muffler assembly from the exhaust outlet.

3. Remove the exhaust gasket from the outlet.

Remove Air Cleaner Assembly
Remove the air cleaner components from the air cleaner base as outlined in Section 4.

Remove the Quad-Clean™ Base
Remove the air cleaner base from the engine as follows:

1. Remove the hex flange nuts and screws securing the carburetor shroud to the engine. See Figure 9-7.
2. Remove the shroud.

3. Remove one hex flange screw and two hex flange nuts securing the air cleaner base to the carburetor. See Figure 9-8.

4. Disconnect one end of the breather hose from the valve cover or air cleaner base. See Figure 9-8.

5. Pull the air cleaner base off the studs.

6. Remove the air cleaner base gasket from the two mounting studs.

7. Loosely install two hex flange nuts on the studs (to temporarily hold the carburetor on the engine).

Remove the Low-Profile Air Cleaner Base
Remove the air cleaner base from the engine as follows:

1. Remove one hex flange screw and two hex flange nuts securing the air cleaner base to the carburetor. See Figure 9-9.

2. Disconnect one end of the breather hose from the valve cover or air cleaner base. See Figure 9-10.

3. Remove the base.

4. Remove the air cleaner base gasket from the two mounting studs.

5. Loosely install two hex flange nuts on the studs (to temporarily hold the carburetor on the engine).
Remove Fuel Tank (If Equipped)
NOTE: If no fuel tank is equipped, loosen the clamp and disconnect the fuel line from the inlet of the carburetor.

1. Ensure that the fuel tank is empty.

2. Loosen the clamp and disconnect the fuel line from the inlet of the shut-off valve. See Figure 9-11.

3. Remove two hex flange screws and two hex flange nuts securing the fuel tank to the engine brackets and remove the tank from the engine. See Figures 9-12 and 9-13.

Remove External Throttle, Governor and Choke Linkage

1. Mark which hole location the governor spring is in on each side. Remove the single hex flange nut and washer securing the throttle control lever to the crankcase. Unhook the spring and remove the lever. See Figures 9-14 or 9-15.

2. Loosen the hex flange nut securing the governor lever to the governor shaft. Lift off the governor lever and remove the carburetor throttle link and dampening spring. See Figures 9-14 or 9-15.
Remove Carburetor

**WARNING**

Gasoline may be present in the carburetor and fuel system. Gasoline is extremely flammable, and its vapors can explode if ignited. Keep sparks, open flames and other sources of ignition away from the engine.

1. Disconnect the throttle link and dampening spring from the carburetor. Remove the carburetor, carburetor gasket, insulator, and insulator gasket from the studs. See Figure 9-16.

![Figure 9-16. Carburetor Removal.](image)

**NOTE:** To remove the carburetor without disturbing the governor lever mounting, pull the carburetor outward and off the mounting studs. Tilt the carburetor and disconnect the throttle link and dampening spring from the throttle lever.

Remove Retractable Starter

1. Remove the three hex flange screws securing the retractable starter to the blower housing. Remove the starter. See Figure 9-17.

![Figure 9-17. Removing Starter Mounting Screws.](image)

Remove Blower Housing and Shields

1. Remove the hex flange screws and two hex flange nuts (CH270 only) securing the blower housing. See Figures 9-18, 9-19, and 9-20.

![Figure 9-18. Remove CH270 Blower Housing Hardware.](image)

![Figure 9-19. Remove CH395, CH440 Blower Housing Hardware.](image)
Section 9
Disassembly

4. Remove the hex flange screws securing the lower shield and remove the shield. See Figures 9-23 and 9-24.

2. Remove the blower housing.

3. Remove the hex flange screws securing the upper shield and remove the shield. See Figures 9-21 or 9-22.

Remove Electrical Wiring, Micro Shut Down Switch & Bracket and Fuel Tank Brackets

1. Disconnect the wiring harness bullet connectors for the Oil Sentry™ float switch and module. Remove the mounting screw securing the module to the fuel tank bracket. See Figure 9-25.
2. Remove both fuel tank brackets by removing the two screws in each. Remove the threaded stud from the left bracket and remove the micro switch bracket. See Figure 9-26.

NOTE: For CH395 and CH440 it is not required and not recommended to remove the threaded stud and micro switch bracket.

Remove Control Panel and Electric Starter (If Equipped)

1. Disconnect the wires from the control panel to the starter, Oil Sentry™, ignition module, and the rectifier-regulator. See Figure 9-27.

NOTE: To ease reassembly, label wires for proper reconnection as wiring colors may not match.

2. Remove the hex flange screws securing the control panel bracket to the crankcase, and remove the control panel. Note the two ground wires secured by one of the screws.

3. Remove the hex flange screws securing the electric starter to the crankcase, and remove the electric starter.
Section 9
Disassembly

Remove Valve Cover/Breather, Rocker Arms, Push Rods and Cylinder Head Assembly

1. Remove the hex flange screw and washer and remove the valve cover and gasket from the engine. See Figure 9-30. The breather assembly is inside the valve cover.

![Figure 9-30. Valve Cover Removal.](image)

2. Loosen and remove the rocker arm lock and adjuster nuts. Remove the rocker arms and push rods. See Figure 9-31.

   NOTE: Mark the location of the push rods and any other part removed that will be reused.

![Figure 9-31. Rocker Arm Removal.](image)

3. Remove the spark plug.

4. Remove the four hex flange screws securing the cylinder head. See Figure 9-32.

![Figure 9-32. Remove Cylinder Head Mounting Screws.](image)

5. Remove the cylinder head, dowel pins (2), and cylinder head gasket. See Figure 9-33.

![Figure 9-33. Remove Cylinder Head, Dowel Pins and Gasket.](image)

Remove Valves

1. Supporting the head of the valve from below, depress the valve keeper and valve spring until the keeper can be released from the valve stem. Remove the valve spring and valve from the head. Repeat this procedure for the remaining valve. See Figure 9-34.

   NOTE: Mark the locations of any part removed that will be reused.
9. Remove and replace the valve stem seals whenever the cylinder head is serviced or disassembled. See Figure 9-35.

Remove Flywheel

NOTE: Whenever possible, an impact wrench should be used to loosen the flywheel retaining nut. A flywheel strap wrench may be used to hold the flywheel when loosening or tightening the flywheel retaining nut.

1. Remove the flywheel retaining nut. See Figures 9-37 and 9-38.

Remove Ignition Module

1. Remove the two hex flange screws securing the ignition module to the crankcase. Remove the module. See Figure 9-36.
Disassembly

2. Remove the drive cup and fan from the flywheel. See Figures 9-39 and 9-40.

3. Remove hex screw and shield (CH270 only) on right side of flywheel (required for use of puller in next step). See Figure 9-41.

4. Remove the flywheel from the crankshaft using a suitable puller. See Figure 9-42.

NOTE: Always use a puller to remove the flywheel from the crankshaft. Do not strike the flywheel or crankshaft as these parts could become cracked or damaged.

5. Remove the flywheel key from the crankshaft keyway.

Remove Stator (If Equipped)

1. Remove the screw securing the stator wire bracket and remove the bracket. See Figure 9-43.

2. Remove the hex flange screws securing the stator to the crankcase. See Figure 9-43.
Remove Closure Plate

1. Remove the hex flange screws securing the closure plate to the crankcase. See Figures 9-44 and 9-45.

2. Remove the closure plate gasket and dowel pins if required from the crankcase. See Figures 9-46 and 9-47.

    NOTE: Do not pry on the gasket surface of the crankcase or closure plate, as this can cause damage and leakage.

Remove Balance Shaft (If Equipped)

1. Remove the balance shaft by pulling it straight out of the crankcase. See Figure 9-48.

Figure 9-43. Remove Bracket and Stator.

Figure 9-44. CH270 Closure Plate Mounting Screws.

Figure 9-45. CH395, CH440 Closure Plate Mounting Screws.

Figure 9-46. CH270 Closure Plate Gasket and Dowel Pins.

Figure 9-47. CH395, CH440 Closure Plate Dowel Pins.
Section 9
Disassembly

Remove Camshaft and Valve Tappets
1. Remove the camshaft by pulling it straight out of the crankcase. See Figure 9-49.

2. Remove the valve tappets by pulling them straight out of the crankcase. See Figure 9-49. Mark their positions.

Remove Piston, Connecting Rod and Crankshaft
1. Remove the two screws securing the end cap to the connecting rod. Remove the end cap. Carefully guiding the connecting rod, slide the piston and connecting rod from the cylinder bore. See Figure 9-50.

NOTE: If a carbon ridge is present at the top of the cylinder bore, use a ridge reamer to remove it before attempting to remove the piston.

Remove Oil Sentry™ System
1. Remove the nut securing the Oil Sentry™ lead wire grommet assembly in the crankcase. See Figure 9-52.
2. Pull the grommet assembly from the crankcase on the inside.

3. Remove the two hex screws securing the Oil Sentry™ float switch to the crankcase. Remove the float switch assembly. See Figure 9-53.

Figure 9-53. Removing Oil Sentry™ Float Switch.

Remove Governor Assembly

CH270 Governor Gear Assembly
1. Remove the cup and washer from the governor gear. See Figure 9-54.

Figure 9-54. Removing Governor Assembly Cup and Washer.

2. Using a suitable drift, drive the governor gear shaft from the crankcase. See Figure 9-55.

Figure 9-55. Remove Governor Gear Shaft.

NOTE: Mark the orientation of all parts as the governor assembly is removed. See Figure 9-56.

Figure 9-56. CH270 Governor Assembly Components.

3. Remove the hitch pin and washer from the governor cross shaft. See Figure 9-57.

Figure 9-57. Removing Governor Cross Shaft Hitch Pin.

4. Remove the cross shaft from inside the crankcase.

CH395 Governor Gear Assembly
1. The governor gear is located in the closure plate. To remove the governor gear, pull the governor gear off the shaft. See Figure 9-58.

NOTE: The governor gear shaft is pressed into the closure plate, and should not be removed.

9.13
Section 9
Disassembly

Figure 9-58. Removing Governor Assembly Cup and Washer.
NOTE: Take note of the orientation of the governor gear components. See Figure 9-59.

Figure 9-59. CH395 Governor Assembly Components.

2. Remove the hitch pin and washer from the governor cross shaft. See Figure 9-60.

Figure 9-60. Removing Governor Cross Shaft Hitch Pin.

3. Remove the cross shaft from inside the crankcase.

CH440 Governor Gear Assembly
1. The governor gear is located in the closure plate. To remove the governor gear, pry underneath the gear to lift it off the shaft. See Figure 9-61.

NOTE: Do not pry on the gasket surface of the closure plate, as this can cause damage and leakage.

Figure 9-61. Pry Governor Gear to Remove.
NOTE: Take note of the orientation of the governor gear components. See Figure 9-62.

Figure 9-62. CH440 Governor Assembly Components.

NOTE: The governor gear shaft is pressed into the closure plate, and should not be removed unless damaged.

2. If the governor gear shaft is bent or damaged, remove it by pulling straight out.

3. Remove the hitch pin and washer from the governor cross shaft. See Figure 9-63.
Section 9
Disassembly

4. Remove the cross shaft from inside the crankcase.

Remove Crankcase and Closure Plate Seals and Bearings
1. Remove the oil seal from the crankcase. See Figure 9-64.

2. Using a suitable press, push the crankshaft bearing from the crankcase. See Figure 9-65.

3. Remove the oil seal from the closure plate. See Figure 9-66.

4. Using a suitable press, push the crankshaft bearing from the closure plate. See Figure 9-67.

NOTE: Inspect the bearings for signs of wear by rotating the inner race and examine for marring or cracks. Check to make sure the race moves easily and is not sloppy. If the bearing is tight and rotates smoothly, removal is not necessary. If you feel any roughness or chattering or the bearing is sloppy, it should be replaced.
This section covers the operation, inspection, and repair/reconditioning of major internal engine components. The following components are not covered in this section. They are covered in sections of their own:

Section 4: Air Cleaner and Air Intake System
Section 5: Fuel System and Governor
Section 7: Retractable Starter
Section 8: Electrical System and Components

Clean all parts thoroughly. Only clean parts can be accurately inspected and gauged for wear or damage. There are many commercially available cleaners that will quickly remove grease, oil, and grime from engine parts. When such a cleaner is used, follow the manufacturer’s instructions and safety precautions carefully. Make sure all traces of the cleaner are removed before the engine is reassembled and placed into operation. Even small amounts of these cleaners can quickly break down the lubricating properties of engine oil.

Do not scrape the gasket surfaces, as any scratches, nicks, or burrs can result in leaks. Use an aerosol gasket remover, paint stripper, or lacquer thinner to remove any gasket residue. Apply the solvent, allow time for it to work, and then brush the surface with a brass wire brush. Clean the surface with isopropyl alcohol, lacquer thinner, or aerosol electrical contact cleaner.

Refer to A Guide to Engine Rebuilding (TP-2150-A) for additional information. Measurement Guide (TP-2159-B) and Engine Inspection Data Record (TP-2435) are also available; use these to record inspection results.

Automatic Compression Release (ACR)
These engines are equipped with an Automatic Compression Release (ACR) mechanism. ACR lowers compression at cranking speeds to make starting easier.

Operation
The ACR mechanism consists of a spring-loaded arm and sliding pin mounted to the camshaft. When the engine is rotating at low cranking speeds the arm holds the pin so it protrudes above the heel of the exhaust cam. This holds the exhaust valve off of its seat during the first part of the compression stroke. See Figure 10-1.

After the engine speed increases centrifugal force causes the spring-loaded arm to move outward causing the pin to retract. When in this position the pin has no effect on the exhaust valve and the engine operates at full compression and power.
Section 10
Inspection and Reconditioning

Benefits
As a result of the reduced compression at cranking speeds, several important benefits are obtained:

1. Manual (retractable) starting is much easier. Without ACR, manual starting would be virtually impossible.

2. Electric start models can use a smaller starter and battery that are more practical for the application.

3. ACR eliminates the need for a spark retard/advance mechanism. A spark retard/advance mechanism would be required on engines without ACR to prevent the kickback that would occur during starting. ACR eliminates this kickback making manual starting safer.

4. The choke control setting is less critical with ACR. In the event of flooding, excess fuel is blown out the opened exhaust valve and does not hamper starting.

5. Engines with ACR start much faster in cold weather than engines without ACR.

6. Engines with ACR can be started with spark plugs that are worn or fouled. Engines without ACR are more difficult to start with those same spark plugs.

Camshaft & Tappets

Inspection and Service
Inspect the gear teeth of the camshaft. If the teeth are badly worn, chipped, or some are missing, replacement of the camshaft will be necessary. If unusual wear or damage is evident on either lobe or the mating tappet, the camshaft and both tappets must be replaced. Check the condition and operation of the ACR mechanism. See Figure 10-2.

Measure the cam lobe profile, A and B, as shown in Figures 10-3 and 10-4 using an outside micrometer and compare with specifications listed.

**Crankshaft**

**Inspection and Service**

Inspect the gear teeth of the crankshaft. If the teeth are badly worn, chipped, or some are missing, replacement of the crankshaft will be necessary.

Inspect the crankshaft bearing surfaces for scoring, grooving, etc. Measure the running clearance between the crankshaft journals and their respective bearing bores. Use an inside micrometer or telescoping gauge to measure the inside diameter of both bearing bores in the vertical and horizontal planes. Use an outside micrometer to measure the outside diameter of the crankshaft main bearing journals. Subtract the journal diameters from their respective bore diameters to get the running clearances. Check the results against the values in Section 1, Specifications and Tolerances. If the running clearances are within specification, and there is no evidence of scoring, grooving, etc., no further reconditioning is necessary. If the bearing surfaces are worn or damaged, the crankcase and/or closure plate will need to be replaced.

Inspect the crankshaft keyways. If worn or chipped, replacement of the crankshaft will be necessary. Inspect the crankpin for score marks or metallic pickup. Slight score marks can be cleaned with crocus cloth soaked in oil. If wear limits, as stated in Section 1, Specifications and Tolerances are exceeded, it will be necessary to replace the crankshaft.
Crankcase

Inspection and Service
Check all gasket surfaces to make sure they are free of gasket fragments. Gasket surfaces must also be free of deep scratches or nicks.

Check the cylinder bore for scoring. In severe cases, unburned fuel can cause scuffing and scoring of the cylinder wall. It washes the necessary lubricating oils off the piston and cylinder wall. As raw fuel seeps down the cylinder wall, the piston rings make metal to metal contact with the wall. Scoring of the cylinder wall can also be caused by localized hot spots resulting from blocked cooling fins or from inadequate or contaminated lubrication.

If the cylinder bore is badly scored, excessively worn, tapered, or out-of-round, resizing is necessary. Use an inside micrometer to determine the amount of wear (refer to Section 1, Specifications and Tolerances). See Figure 10-6.

Honing
While most commercially available cylinder hones can be used with either portable drills or drill presses, the use of a low speed drill press is preferred as it facilitates more accurate alignment of the bore in relation to the crankshaft crossbore. Honing is best accomplished at a drill speed of about 250 RPM and 60 strokes per minute. After installing coarse stones in hone, proceed as follows:

1. Lower hone into bore and after centering, adjust so that the stones are in contact with the cylinder wall. Use of a commercial cutting-cooling agent is recommended.

2. With the lower edge of each stone positioned even with the lowest edge of the bore, start drill and honing process. Move the hone up and down while resizing to prevent the formation of cutting ridges. Check the size frequently.

NOTE: Kohler pistons are custom-machined to exacting tolerances. When over-sizing a cylinder, it should be machined exactly 0.25 mm (0.010 in.) over the new diameter (Section 1, Specifications and Tolerances). The oversize Kohler replacement piston will then fit correctly.

3. When the bore is within 0.064 mm (0.0025 in.) of the desired size, remove the coarse stones and replace them with burnishing stones. Continue with the burnishing stones until the bore is within 0.013 mm (0.0005 in.) of the desired size and then use finish stones (220-280 grit) and polish the bore to its final size. A crosshatch should be observed if honing is done correctly. The crosshatch should intersect at approximately 23°-33° off the horizontal. Too flat an angle could cause the rings to skip and wear excessively, and too steep an angle will result in high oil consumption. See Figure 10-7.

Figure 10-6. Measuring Cylinder Bore.

NOTE: A 0.25 mm (0.010 in.) oversize piston is available if resizing is selected. Initially, resize using a boring bar, then use the following procedures for honing the cylinder.
4. After resizing, check the bore for roundness, taper, and size. Use an inside micrometer, telescoping gauge, or bore gauge to take measurements. The measurements should be taken at three locations in the cylinder – at the top, middle, and bottom. Two measurements should be taken (perpendicular to each other) at each of the three locations.

Clean Cylinder Bore After Honing
Proper cleaning of the cylinder walls following boring and/or honing is very critical to a successful overhaul. Machining grit left in the cylinder bore can destroy an engine in less than one hour of operation after a rebuild.

The final cleaning operation should always be a thorough scrubbing with a brush and hot, soapy water. Use a strong detergent that is capable of breaking down the machining oil while maintaining a good level of suds. If the suds break down during cleaning, discard the dirty water and start again with more hot water and detergent. Following the scrubbing, rinse the cylinder with very hot, clear water, dry it completely, and apply a light coating of engine oil to prevent rusting.

Measuring Piston-to-Bore Clearance
Before installing the piston into the cylinder bore, it is necessary that the clearance be accurately checked. This step is often overlooked, and if the clearances are not within specifications, engine failure will usually result.

NOTE: Do not use a feeler gauge to measure piston-to-bore clearance—it will yield inaccurate measurements. Always use a micrometer.

Use the following procedure to accurately measure the piston-to-bore clearance:

1. Use a micrometer and measure the diameter of the piston above the bottom of the piston skirt and perpendicular to the piston pin. See Figure 10-8.

2. Use an inside micrometer, telescoping gauge, or bore gauge and measure the cylinder bore. Take the measurement approximately 7.0 mm (0.2760 in.) below the top of the bore and perpendicular to the piston pin.

3. Piston-to-bore clearance is the difference between the bore diameter and the piston diameter (Step 2 minus Step 1).

Flywheel

Inspection
Inspect the flywheel for cracks, and the flywheel keyway for damage. Replace flywheel if it is cracked. Replace the flywheel, the crankshaft, and the key if the flywheel key is sheared or the keyway is damaged.
Cylinder Head and Valves

Inspection and Service
After cleaning, check the flatness of the cylinder head and the corresponding top surface of the crankcase, using a surface plate or piece of glass and feeler gauge. The maximum allowable out of flatness is 0.1 mm (0.0039 in.).

Carefully inspect the valve mechanism parts. Inspect the valve springs and related hardware for excessive wear or distortion. Check the valves and valve seat area or inserts for evidence of deep pitting, cracks, or distortion. Check clearance of the valve stems in the guides. See Figure 10-9 for valve details.

Hard starting, or loss of power accompanied by high fuel consumption may be symptoms of faulty valves. Although these symptoms could also be attributed to worn rings, remove and check the valves first. After removal, clean the valve heads, faces, and stems with a power wire brush. Then, carefully inspect each valve for defects such as warped head, excessive corrosion, or worn stem end. Replace valves found to be in bad condition. A normal valve and valves in bad condition are shown in the accompanying illustrations.

Normal: Even after long hours of operation a valve can be reconditioned and reused if the face and margin are in good shape. If a valve is worn to where the margin is less than 1/32 in. do not reuse it. The valve shown was in operation for almost 1000 hours under controlled test conditions.

Bad Condition: The valve depicted here should be replaced. Note the warped head; margin damaged and too narrow. These conditions could be attributed to excessive hours or a combination of poor operating conditions.

Leakage: A poor grind on face or seat of valve will allow leakage resulting in a burned valve on one side only.

Coking: Coking is normal on intake valves and is not harmful. If the seat is good, the valve could be reused after cleaning.
Section 10
Inspection and Reconditioning

Excessive Combustion Temperatures: The white deposits seen here indicate very high combustion temperatures, usually due to a lean fuel mixture.

Overheating: An exhaust valve subject to overheating will have a dark discoloration in the area above the valve guide. Worn guides and faulty valve springs may cause this condition. Also check for clogged air intake, and blocked fins when this condition is noted.

Valve Guides
If a valve guide is worn beyond specifications, it will not guide the valve in a straight line. This may result in burnt valve faces or seats, loss of compression, and excessive oil consumption.

To check valve guide-to-valve stem clearance, thoroughly clean the valve guide and, using a split-ball gauge, measure the inside diameter of the guide. Then, using an outside micrometer, measure the diameter of the valve stem at several points on the stem where it moves in the valve guide. Use the largest stem diameter to calculate the clearance by subtracting the stem diameter from the guide diameter. If the intake or exhaust clearance exceeds the specifications in the Valve Specification table, determine whether the valve stem or guide is responsible for the excessive clearance.

If the guides are within limits but the valve stems are worn beyond limits, install new valves.

Gum: Gum deposits usually result from using stale gasoline. Gum is a prevalent cause of valve sticking. The cure is to ream the valve guides and clean or replace the valves, depending on their condition.

Stem Corrosion: Moisture in fuel or from condensation is the most common causes of valve stem corrosion. Condensation occurs from improper preservation during storage and when engine is repeatedly stopped before it has a chance to reach normal operating temperatures. Replace corroded valves.
Valve Seat Inserts
Hardened steel alloy intake and exhaust valve seat inserts are press-fitted into the cylinder head. The inserts are not replaceable but can be reconditioned if not too badly pitted or distorted. If cracked or badly warped, the cylinder head should be replaced.

Recondition the valve seat inserts following the instructions provided with the valve seat cutter being used. A typical cutter is shown in Figure 10-10. Cutting the proper valve face angle, as specified in the Valve Specification table and the proper valve seat angle (89.5°-90°) will achieve the desired 0° (1° full cut) interference angle where the maximum pressure occurs on the outside diameters of the valve face and seat.

Figure 10-10. Typical Valve Seat Cutter.

Lapping Valves
Reground or new valves must be lapped in, to provide fit. Use a hand valve grinder with suction cup for final lapping. Lightly coat valve face with fine grade of grinding compound, then rotate valve on seat with grinder. Continue grinding until smooth surface is obtained on seat and on valve face. Thoroughly clean cylinder head in soap and hot water to remove all traces of grinding compound. After drying cylinder head, apply a light coating of SAE 10 oil to prevent rusting.

Valve Stem Seals
These engines use valve stem seals on the intake and exhaust valves. See Figure 10-11.

Figure 10-11. Valve Stem Seals.

Pistons and Rings

Inspection
Scuffing and scoring of pistons and cylinder walls occurs when internal engine temperatures approach the welding point of the piston. Temperatures high enough to do this are created by friction, which is usually attributed to improper lubrication and/or overheating of the engine.

Normally, very little wear takes place in the piston boss-piston pin area. If the original piston and connecting rod can be reused after new rings are installed, the original pin can also be reused but new piston pin retainers are required. The piston pin is included as part of the piston assembly – if the pin boss in the piston or the pin are worn or damaged, a new piston assembly is required.

Ring failure is usually indicated by excessive oil consumption and blue exhaust smoke. When rings fail, oil is allowed to enter the combustion chamber where it is burned along with the fuel. High oil consumption can also occur when the piston ring end gap is incorrect because the ring cannot properly conform to the cylinder wall under this condition. Oil control is also lost when ring gaps are not staggered during installation.

When cylinder temperatures get too high, lacquer and varnish collect on pistons causing rings to stick, which results in rapid wear. A worn ring usually takes on a shiny or bright appearance.
Scratches on rings and pistons are caused by abrasive material such as carbon, dirt, or pieces of hard metal. Detonation damage occurs when a portion of the fuel charge ignites spontaneously from heat and pressure shortly after ignition. This creates two flame fronts, which meet and explode to create extreme hammering pressures on a specific area of the piston. Detonation generally occurs from using low octane fuels.

Pre-ignition, or ignition of the fuel charge before the timed spark can cause damage similar to detonation. Pre-ignition damage is often more severe than detonation damage. Pre-ignition is caused by a hot spot in the combustion chamber such as glowing carbon deposits, blocked cooling fins, an improperly seated valve, or wrong spark plug(s).

See Figure 10-12 for some common types of piston and ring damage.
Replacement pistons are available in STD bore size, and 0.25 mm (0.010 in.) oversize. Replacement pistons include new piston ring sets and new piston pins.

Replacement ring sets are also available separately for STD, and 0.25 mm (0.010 in.) oversize pistons. Always use new piston rings when installing pistons. Never use old rings.

Some important points to remember when servicing piston rings:

1. The cylinder bore must be de-glazed before service ring sets are used.

2. If the cylinder bore does not need re-boring and if the old piston is within wear limits and free of score or scuff marks, the old piston may be reused.

3. Remove the old rings and clean up the grooves. Never reuse old rings.

4. Before installing the new rings on the piston, place the top two rings, each in turn, in its running area in the cylinder bore and check the end gap. See Figure 10-13. Compare the ring gap to the measurements in Section 1, Specifications and Tolerances.

5. After installing the new compression (top and middle) rings on the piston, check the piston-to-ring side clearance. Compare the clearance to specifications listed in Section 1, Specifications and Tolerances. If the side clearance is greater than specified, a new piston must be used. See Figure 10-14.

**Figure 10-14. Measuring Piston Ring Side Clearance.**

**Install New Piston Rings**

To install new piston rings, proceed as follows:

NOTE: Rings must be installed correctly. Install the bottom (oil control) ring first and the top compression ring last. See Figure 10-15.

**Figure 10-15. Piston Ring Positions.**

Use a piston ring expander to install rings. See Figure 10-16.
Section 10
Inspection and Reconditioning

Figure 10-16. Piston Ring Expander.

1. **Oil Control Ring (Bottom Groove):** Install the expander and then the rails. Make sure the ends of the expander are not overlapped. See Figure 10-17.

2. **Middle Compression Ring (Center Groove):** Install the center ring using a piston ring expander tool. Make sure the identification mark is up or the colored dye stripe (if contained) is to the left of the end gap. See Figure 10-17.

3. **Top Compression Ring (Top Groove):** Install the top ring using a piston ring expander tool. Make sure the identification mark is up or the colored dye stripe (if contained) is to the left of the end gap. See Figure 10-17.

**Connecting Rods**
Offset, stepped-cap connecting rods are used in all these engines.

**Inspection and Service**
Check the bearing area (big end) for excessive wear, score marks, running and side clearances (see Section 1, Specifications and Tolerances). Replace the rod and cap if scored or excessively worn.

Service replacement connecting rods are available in STD size and 0.25 mm (0.010 in.) undersize. The 0.25 mm (0.010 in.) undersized rods have an identification marking on the lower end of the rod shank. Always refer to the appropriate parts information to ensure that correct replacements are used.

**Closure Plate Assembly**

**Inspection**
Inspect the main bearing surface for wear or damage. Refer to Section 1, Specifications and Tolerances. Replace the closure plate if required.

**Governor Assembly (Internal)**

**Inspection**
Inspect the governor gear teeth. Replace the gear if it is worn, chipped, or if any teeth are missing. Inspect the governor weights. They should move freely in the governor gear.

**Breather Design**
The breather system is designed to control the amount of oil in the head area and still maintain the necessary vacuum in the crankcase. The system includes an inner chamber in the valve cover containing a mesh filter, spring steel reed, and retainer.

When the pistons move downward, crankcase gases move through a passage to the inner chamber. In turn, air is pushed past the reed to the intake system. The upward travel of the pistons closes the reed and creates a low vacuum in the lower crankcase. This separates the oil from the airflow in the mesh filter. Any oil separated through the filter drains back into the crankcase through a small hole in the inner valve cover.
Section 11
Reassembly

General
NOTE: Make sure the engine is assembled using all specified torque values, tightening sequences, and clearances. Failure to observe specifications could cause severe engine wear or damage. Always use new gaskets.

Typical Reassembly Sequence
The following sequence is suggested for complete engine reassembly. This procedure assumes that all components are new or have been reconditioned, and all component subassembly work has been completed. The sequence may vary to accommodate options or special equipment. Detailed procedures can be found in subsequent subsections.

1. Install crankcase bearings and oil seals.
2. Install governor assembly.
3. Install Oil Sentry™ system.
4. Install crankshaft.
5. Install connecting rod with piston and rings.
6. Install balance shaft.
7. Install valve tappets and camshaft.
8. Install closure plate.
9. Install stator
10. Install flywheel.
11. Install ignition module.
12. Assemble cylinder head.
13. Install cylinder head.
15. Install valve cover.
16. Install fuel tank supports and shut down switch with bracket.
17. Install carburetor.
18. Install engine shrouds and air cleaner base.
19. Install electric starter and control panel
20. Install blower housing.
21. Install retractable starter.
22. Install throttle link, governor lever, governor spring and throttle lever.
23. Install Oil Sentry™ module.
24. Install fuel tank.
25. Install carburetor cover.
26. Install muffler and heat shield assembly.
27. Install air cleaner element and cover.
28. Prepare engine for operation.
29. Testing the engine.

Install Crankcase Bearings and Oil Seals
1. Make sure there are no nicks, burrs, or damage in the bores for the bearings. The crankcase (see Figure 11-1) and closure plate (see Figure 11-2) must be clean.
2. Use an arbor press to make sure the bearings are installed straight into their respective bores, until fully seated.

NOTE: Oil the bearings liberally with engine oil when installing.
Section 11
Reassembly

NOTE: In steps 3 and 4 that follow, position the oil seals with the manufacturer’s identification marks visible and facing you.

3. Using an appropriate seal driver, install the oil seal into the closure plate to the depth specified below. See Figures 11-3 and 11-4.

Install to a depth of:
CH270 5.5 mm (0.217 in.) from the outer surface
CH395 7.0 mm (0.276 in.) from the outer surface
CH440 8.2 mm (0.323 in.) from the outer surface

5. Apply a light coating of lithium grease to seal lips after installing.

Install Governor Assembly

CH270
1. Install the governor shaft through the gear and add the thrust washer to the shaft. See Figures 11-6 and 11-7.

2. Install governor gear assembly into the crankcase using a press, or a drift with light taps, until the tip of the shaft is 78.862 mm (3.105 in.) below the machined gasket surface of the crankcase. See Figures 11-6 and 11-7. Install the washer and cup on the shaft.
3. Install one thrust washer onto the governor cross shaft and slide the shaft up through the inside of the crankcase. See Figure 11-8.

4. Install the second flat washer onto the shaft. Position the shaft so the flat index end of the shaft faces to the left (9 o’clock position) and install the hitch pin so the end of the pin comes in contact with the raised boss on the housing, limiting inward movement of the shaft. See Figure 11-9.

1. Assemble the governor gear pin into the governor gear so the pin rim is held in place by the weight retainers. See Figure 11-10.

2. Place the thrust washer on the governor gear shaft in the closure plate. Push the governor gear onto the shaft. See Figure 11-11.
NOTE: The governor gear shaft is pressed into the closure plate and should not be removed.

3. Install one thrust washer onto the governor cross shaft and slide the shaft up through the inside of the crankcase. See Figure 11-12.

![Figure 11-12. Installing Governor Shaft.](image)

4. Install the second flat washer onto the shaft. Position the shaft so the flat index end of the shaft faces to the left (9 o’clock position) and insert the hitch pin from the PTO side. See Figure 11-13.

![Figure 11-13. Installing Thrust Washer and Hitch Pin.](image)

CH440
1. If the shaft was removed in disassembly, use an arbor press to install the new shaft to a height of 16.025 mm (0.6309 in.) from the closure plate sealing surface. See Figure 11-14.

![Figure 11-14. Install Governor Gear Shaft.](image)

2. Place the washer onto the shaft, then place the governor gear onto the shaft.

3. Press a new ring onto the shaft about 1/8 in.

4. Pull the governor gear up until it makes contact with the ring, then place the pin in the cup, retaining the rim with the weights. See Figure 11-15.

![Figure 11-15. Install Governor Gear.](image)

5. Push down on the pin, snapping the ring into the shaft groove.

6. Pull up slightly on the governor gear to ensure the assembly is installed correctly.

7. Install one thrust washer onto the governor cross shaft and slide the shaft up through the inside of the crankcase. See Figure 11-16.
Section 11
Reassembly

Install Oil Sentry™ System
1. Mount the Oil Sentry™ float switch into the crankcase housing using two M6x18 hex flange screws and torque to 8 N·m (71 in. lb.). See Figure 11-18.

2. Route the wire lead grommet assembly through the crankshaft housing. See Figure 11-18.

3. Install the nut on the grommet assembly external stud and torque to 10 N·m (89 in. lb.). See Figure 11-19.

Install Crankshaft
1. Carefully slide the flywheel end of the crankshaft through the main ball bearing and seal. See Figure 11-20.
Install Connecting Rod with Piston and Rings

1. Make sure the following is correct before installing.

   a. The locating mark on the piston is down. See Figure 11-21.

   b. The connecting rod offset is down and oil hole is in the 4 o’clock position shown. Match marks should align as shown with dipper down. See Figure 11-22.

2. Stagger the piston rings in the grooves as shown in Figure 11-23.

3. Lubricate cylinder bore, piston, piston pin, and piston rings with engine oil. Compress the rings using a piston ring compressor.

4. Lubricate the crankshaft journal and connecting rod bearing surfaces with engine oil.

5. Ensure “V” stamping on piston is facing down toward the base of the engine. Use a hammer handle or rounded wood dowel and gently tap the piston into the cylinder as shown in Figure 11-24. Be careful that the oil ring rails do not spring free between the bottom of the ring compressor and the top of the cylinder.
Section 11
Reassembly

6. Install the connecting rod cap to the connecting rod so the dipper is down, and the match marks are aligned. See Figures 11-25 and 11-26.

7. Torque both screws in increments to:
   CH270 12 N·m (106 in. lb.)
   CH395, CH440 20 N·m (177 in. lb.)

Install Balance Shaft (If Equipped)
1. Position the crankshaft so the timing mark on the larger crankgear is in the 8 o’clock position.

2. Install the balance shaft, aligning the timing mark with the timing mark on the larger crankgear. See Figure 11-27.

Install Valve Tappets and Camshaft
1. Lubricate the face and stem of each tappet with engine oil. Install each into their respective bores. See Figure 11-28.

2. Lubricate the camshaft bearing surfaces and cam lobes as well as the camshaft bore in the crankcase with engine oil.

Figure 11-24. Installing Piston Using a Ring Compressor.
Figure 11-25. Rod Dipper Orientation.
Figure 11-26. Connecting Rod Match Marks.
Figure 11-27. Aligning Timing Marks.
Figure 11-28. Tappet Installation.
3. Rotate the crankshaft to TDC so the timing mark (dimple) on the smaller crankgear is in the 4 o’clock position. Install the camshaft into the crankcase, aligning the timing marks on the two gears. See Figure 11-29.

3. Install the closure plate to the crankcase. Carefully seat the ends of the camshaft and balance shaft into their mating bearings. Rotate the crankshaft slightly to help engage the governor gear teeth.

4. Install the hex flange screws securing the closure plate to the crankcase. Torque hex flange screws to 24 N·m (212 in. lb.). See Figure 11-31 or 11-32 for the torque sequence.

Install Closure Plate
1. Check to make sure the sealing surfaces of the crankcase and closure plate are clean and free of nicks/burrs.

2. Install the two dowel pins into the locations shown in the crankcase. Install the new closure plate gasket (dry) onto the dowel pins.

NOTE: Make sure the governor lever is against the cup on the governor gear assembly.

Completed assembly, before closure plate is installed, should look like Figure 11-30.
Install Stator (If Equipped)
1. Position the stator aligning the mounting holes so the leads are in the 3 o’clock position.

2. Install and torque the four hex flange screws to 10 N·m (89 in. lb.) in the sequence of 1, 2, 3, 4 and then torque 1 again. See Figure 11-33.

3. Route the stator leads along the crankcase and out the notch on the side.

4. Position the bracket over the stator leads and install and torque the screw to 10 N·m (89 in. lb.). See Figure 11-34.

Figure 11-33. Stator Screws Torque Sequence.

Figure 11-32. CH395, CH440 Closure Plate Torque Sequence.

Figure 11-34. Install Bracket and Torque Screw.

Figure 11-35. Clean and Dry Taper of Crankshaft and Flywheel Bore.

Install Flywheel

WARNING: Damaging Crankshaft and Flywheel Can Cause Personal Injury!

Using improper procedures to install the flywheel can crack or damage the crankshaft and/or flywheel. This not only causes extensive engine damage, but can also cause personal injury, since broken fragments could be thrown from the engine. Always observe and use the following precautions and procedures when installing the flywheel.

NOTE: Before installing the flywheel make sure the crankshaft taper and flywheel hub bore are clean, dry, and completely free of lubricants. The presence of lubricants can cause over-stressing and damage when the flange nut is torqued to specification. See Figure 11-35.

NOTE: In the following step, make sure the flywheel key is installed properly in the keyway. The flywheel can become cracked or damaged if the key is not installed properly.
1. Install the woodruff key into the keyway of the crankshaft. Make sure that the key is properly seated and parallel with taper of shaft. See Figure 11-36.

![Figure 11-36. Crankshaft Flywheel Key Position.](image)

2. Install the flywheel onto the crankshaft, being careful not to shift the position of the woodruff key.

3. Install flywheel shield and secure with one hex flange screw (CH270 only). See Figure 11-37.

![Figure 11-37. Install Flywheel Shield.](image)

4. Install the fan bosses into the matching holes in the flywheel. See Figure 11-38.

![Figure 11-38. Install Flywheel Fan.](image)

5. Position the drive cup on the flywheel, engaging the boss on its base with the corresponding hole in the flywheel. Hold in position and install the hex flange nut. Finger tighten to keep cup indexed. See Figure 11-39.

![Figure 11-39. Install Drive Cup.](image)

**NOTE:** The CH395, CH440 has a boss on the fan and a hole in the drive cup.

6. Use a flywheel holding tool and torque wrench to tighten the flywheel nut. See Figure 11-40. Torque the hex flange nut to:
   - CH270 74 N·m (655 in. lb.)
   - CH395, CH440 113 N·m (1000 in. lb.)
Install Ignition Module

1. Turn the flywheel so the magnet is away from the location where the ignition module will be installed. See Figure 11-41.

2. Install the ignition module loosely to the bosses with the two hex flange screws. Move the module as far away from the flywheel as possible, then tighten the screws just enough to hold it in position. See Figure 11-41.

NOTE: Ensure the ignition module is correctly oriented.

3. Rotate the flywheel until the magnet is under one leg of the ignition module. See Figure 11-42.

4. Insert a 0.254 mm (0.010 in.) flat feeler gauge between the leg of the module and the magnet. Loosen the nearest screw allowing the magnet to draw the module against the feeler gauge. Push against the module to hold the leg tight against the feeler gauge while tightening the screw. See Figure 11-42.

5. Rotate the flywheel until the magnet is under the other leg of the module. Loosen the nearest screw allowing the magnet to draw the module against the feeler gauge. Push against the module to hold the leg tight against the feeler gauge while tightening the screw.

6. Torque the first hex flange screw, then the second hex flange screw. Go back and torque the first hex flange screw one more time. Torque both module screws to 10 N·m (89 in. lb.).

7. Rotate the flywheel back and forth, checking to make sure the magnet does not strike the module.

8. Connect the kill wire to the ignition module bottom blade terminal and route the wire lead to the top of the crankcase. See Figure 11-43.
Assemble Cylinder Head

1. Install the valves into their respective positions.

2. Install new valve seals on the stem of the valves. See Figure 11-44.

3. Install the valve springs and retainers into their respective locations in the cylinder head. Support the valve heads from underneath. Using hand pressure, compress each valve spring and slide each retainer onto the valve stem to lock in place. See Figure 11-45.

Install Cylinder Head

1. Check to make sure there are no nicks or burrs on the sealing surfaces of the cylinder head or crankcase.

2. Rotate the crankshaft to position the piston at TDC on the compression stroke.

3. Install the dowel pins into the recesses around the lower cylinder head bolt holes. See Figure 11-46.

4. Install a new cylinder head gasket.

5. Install the cylinder head and start the four hex flange screws. Torque the screws in increments using the sequence shown. See Figure 11-47. Torque the hex flange screws following the table.

Install Push Rods and Rocker Arms

NOTE: Push rods should always be installed in the original location.

1. Identify the proper position of each push rod. Dip the ends of the push rods in engine oil and install them in their respective locations, seating each into the tappet socket. See Figure 11-48.

2. Install the push rod guide plate, aligning the holes for the rocker arm studs. Screw in the rocker arm studs and torque to 13.6 N·m (120 in. lb.).

3. Assemble the rocker arms, adjusters, and locknuts onto the studs and push rods. Finger tighten the rocker arm pivot jam locknuts. See Figure 11-49.

4. Adjust the valve tappet clearance as follows:
   a. Make sure the piston is still at the top of the compression stroke.
   b. Insert a flat feeler gauge between the rocker arm and the valve stem. The recommended valve to rocker arm clearance for both intake and exhaust is 0.076-0.127 mm (0.003-0.005 in.) (Cold). See Figure 11-50.
   c. Adjust clearance as required by loosening the locknut and turning the adjuster.

   Turn clockwise to decrease clearance.
   Turn counterclockwise to increase clearance.
d. Hold the adjuster from turning and tighten the locknut. Torque locknut to 10 N·m (89 in. lb.). See Figure 11-51.

e. Recheck that the clearance is correct.

5. Set the gap of a new Champion® RC12YC or equivalent spark plug to 0.76 mm (0.030 in.).

6. Install the spark plug in the cylinder head and torque to 22-27 N·m (195-239 in. lb.). See Figure 11-52.

Install Valve Cover

1. Install a new valve cover gasket onto the valve cover.

2. Position the valve cover/gasket assembly on the head. Install the hex flange screw and torque to 10 N·m (89 in. lb.). See Figure 11-53.

Install Fuel Tank Supports and Shut Down Switch with Bracket

CH270

1. Position both tank support brackets on the crankcase and loosely install with four hex head screws. See Figure 11-54.

2. Position the shut down switch with bracket on the tank bracket shown (see Figure 11-54) and install the threaded stud to secure.

3. Torque the tank support bracket hardware to 24 N·m (212 in. lb.).

CH395, CH440

1. Position both tank support brackets on the crankcase and install with four hex flange screws. See Figures 11-55 and 11-56. Torque to 24 N·m (212 in. lb.).
NOTE: The threaded stud and bracket with shut down switch should not be removed.

Install Carburetor

1. Install a new insulator to cylinder head gasket onto the carburetor studs, followed by the insulator and the carburetor to insulator gasket. See Figure 11-57.

2. Push the carburetor all the way onto the studs. See Figure 11-58.

3. Connect the throttle link and dampening spring into their respective holes in the throttle lever. See Figure 11-59.

Install Engine Shields and Air Cleaner Base

CH270

1. Install the upper shield on the cylinder, engaging the tab hole on the fuel tank bracket stud. See Figure 11-60.
2. Install one hex flange screw in the rear of top air shield, but do not tighten at this time. See Figure 11-61.

3. Install a new carburetor to air cleaner base gasket onto the carburetor mounting studs followed by the air cleaner base. Attach the breather hose onto the air cleaner base connection port. Connect the opposite end of the breather hose to the valve cover. See Figure 11-62.

4. Secure the base with the two hex flange nuts on the mounting studs and one hex flange screw through the top heat shield into the crankcase housing. Torque hardware to 8 N·m (71 in. lb.). See Figure 11-62.

5. Install the lower heat shield and secure with two hex screws. See Figure 11-63.

CH395, CH440

1. Install the upper shield on the cylinder and secure with two hex flange screws. Torque to 8 N·m (71 in. lb.). See Figure 11-64.
2. Install lower shield on the cylinder and secure with two hex flange screws. Torque to 8 N·m (71 in. lb.). See Figure 11-65.

3. Install a new carburetor to air cleaner base gasket onto the carburetor mounting studs followed by the air cleaner base. Attach the breather hose onto the air cleaner base connection port. Connect the opposite end of the breather hose to the valve cover. See Figure 11-66.

4. Secure the base with the two hex flange nuts on the mounting studs and one hex flange screw into the crankcase housing. Torque hardware to 8 N·m (71 in. lb.). See Figure 11-66.

NOTE: When securing the low-profile air cleaner, the hex flange screw is installed through the base into the blower housing. Torque to 6.7 N·m (59 in. lb.).

Install Electric Starter and Control Panel (If Equipped)

1. Align and mount the electric starter onto the crankcase. Install and torque the two hex flange screws to 24 N·m (212 in. lb.). See Figure 11-67.

2. Connect the electrical leads for the Oil Sentry™, ignition module, key switch, relay, and starter. See Figure 11-68.
3. Mount the control panel to the crankcase and secure with two hex flange screws. Ensure the ground wires are placed between the screw and the bracket. Torque the screws to 24 N·m (212 in. lb.). See Figure 11-69.

Install Blower Housing
1. Position the spark plug lead in the molded clip in the carburetor insulator. See Figure 11-70.

CH270
2. Install the blower housing on the crankcase with two hex flange nuts and two hex flange screws. Torque nuts to 8 N·m (71 in. lb.) and screws to 10 N·m (89 in. lb.). See Figure 11-71.

CH395, CH440
2. Install the blower housing on the crankcase with the hex flange screws. Torque screws to 10 N·m (89 in. lb.). See Figure 11-72.

Install Retractable Starter
1. Install the retractable starter on the blower housing using three hex flange screws. Finger tighten the mounting screws only. See Figure 11-73.
Section 11
Reassembly

2. Pull the rope handle to engage the pawls and center the starter to the drive cup. Hold in this position and torque the mounting screws to 5.4 N·m (48 in. lb.).

Install Throttle Link, Governor Lever, Governor Spring, and Throttle Lever
1. Connect the throttle linkage and dampering spring to the arm of the governor lever as shown. See Figure 11-74.

![Figure 11-74. Governor Lever Installation.](image1)

2. Install the governor lever onto the shaft. Assemble the screw and locknut, but do not tighten. See Figure 11-75.

CH395, CH440
3. Push the governor lever in the direction indicated in Figure 11-76 and hold in this position. Turn the governor shaft counterclockwise until it stops. Tighten the hex flange nut on the governor lever clamp bolt to lock the lever on the shaft. Torque the nut to 12 N·m (106 in. lb.).

![Figure 11-76. Governor Lever Adjustment.](image2)

4. Install the spring on the governor and throttle levers in the holes previously marked in disassembly. Install the throttle lever and a fender washer on the threaded stud of the fuel tank bracket. See Figures 11-77 and 11-78.

![Figure 11-77. Install Throttle Lever for CH270.](image3)

CH270
3. Push the governor lever in the direction indicated in Figure 11-75 and hold against the stop. Turn the governor shaft clockwise until it stops. Tighten the hex flange nut on the governor lever clamp bolt to lock the lever on the shaft. Torque the nut to 12 N·m (106 in. lb.).

![Figure 11-75. Governor Lever Adjustment.](image4)
Section 11
Reassembly

![Image of Throttle Lever and Governor Lever]

5. Install a nylon washer, wave spring, and tabbed washer (with tab engaged in slot) on the stud above the throttle lever and secure with a hex flange nut. Torque the hex flange nut to 9 N·m (80 in. lb.). See Figure 11-79.

Install Oil Sentry™ Module
NOTE: If the Oil Sentry™ module is mounted inside the control panel, skip this step.

1. Install the Oil Sentry™ module and secure with one hex screw. See Figure 11-80. Torque the screw to 3.5 N·m (31 in. lb.).

2. Connect the electrical leads for the Oil Sentry™ module. See Figure 11-80.

Install Fuel Tank
1. Position the fuel tank on the mounting brackets. Secure with hex screws on the inner mounting bracket and on the PTO side strap. See Figure 11-81.

2. Install two hex flange nuts on the fuel tank studs. See Figure 11-82.

3. Torque the side strap screw to 10 N·m (89 in. lb.). See Figure 11-83.

4. Torque the remaining screw and nuts to 24 N·m (212 in. lb.).

5. Position the fuel line in the clip on the bottom of the tank. Connect the fuel line to the shut-off valve on the carburetor and secure with the clamp. See Figure 11-84.
Install Carburetor Cover (If Equipped)

1. Install the outer air cleaner cover onto the studs, over the carburetor. Secure with two hex nuts and two screws. Torque the nuts to 4 N·m (35 in. lb.) and the screws to 1.3 N·m (12 in. lb.) See Figure 11-85.

Install Muffler and Heat Shield Assembly

1. Install a new exhaust gasket onto the exhaust studs.

2. Position the muffler and heat shield assembly and install one hex flange screw in the support bracket and two hex flange screws in the exhaust outlet flange. See Figures 11-86, 11-87, and 11-88.

3. Torque three hex flange screws to:
   CH270 24 N·m (212 in. lb.)
   CH395, CH440 35 N·m (310 in. lb.)
Install Air Cleaner Element and Cover

Install the Quad-Clean™ Air Cleaner
1. Place the air cleaner element with precleaner onto the boss on the air cleaner base. See Figure 11-89.

2. Position the air cleaner cover as required for seasonal operation and engage both cover clips to secure it to the base. See Figure 11-90.

Install the Low-Profile Air Cleaner
1. Place the foam element in the air cleaner base. See Figure 11-91.

Figure 11-89. Installing Air Cleaner Element.

Figure 11-90. Install Air Cleaner Cover.

Figure 11-91. Install Foam Element.

Prepare the Engine for Operation
The engine is now reassembled. Before starting or operating the engine be sure to do the following:

1. Make sure all hardware is properly torqued.

2. Make sure the oil drain plugs, oil fill plugs and Oil Sentry™ wire lead bushing are tightened securely.

3. Fill the crankcase with the correct oil. Refer to the oil recommendations and procedures in the General Information and Lubrication System sections.

Testing the Engine
It is recommended that the engine be operated on a test stand or bench prior to installation on a piece of equipment.

1. Set the engine up on a test stand. Check gas and oil levels. Start the engine and run for 5-10 minutes between idle and midrange. Adjust the carburetor settings as required. Low idle speed should be set to 1800 RPM (± 150) or application specifications. See Figure 11-92.
2. The maximum no load high–idle engine speed is 3750 RPM.

Adjust the high speed stop screw as necessary. See Figure 11-93.

Figure 11-92. Low Idle Speed Adjustment Screw.

Figure 11-93. High Speed Stop Screw.
